Hi-Shear Rivet Tool Company introduces an entirely new, controlled-preload fastener called HI-LOK. Exhaustive tests have proven its reliability and manufacturing facilities are geared for production. The HI-LOK is now available in titanium, type 431 stainless steel, 4130 alloy steel and aluminum. Production sizes range from 3/16″ through 3/8″ with larger sizes to follow.

Write for detailed technical information on HI-LOK and other Hi-Shear fasteners.

Who puts the "Soup" to the Snark?

Special Cells Engineered by Goodyear Stow Fuel for the Snark's Intercontinental Range

New propellants used by today's—and the future's—missiles and pilotless bombers pose awesome problems.

While we cannot discuss these problems in public print, we can point with pride to accomplishments of Goodyear's Aviation Products Division which has solved touchy fuel handling problems.

A good case in point is Northrop's sixty-seven-foot Snark, the only U. S. guided missile which can match the striking radius of strategic jet bombers.

Other examples in the same category include special Goodyear advancements which have made it possible to stow and safely utilize new monopropellants—and to safeguard dangerous fuel- and oxidizer-systems against premature detonation.

If you are working with new fuels, it will pay you dividends to call on the facilities, skills and experience of Goodyear Aviation Products. We have found new materials and methods for taming the new "flighty" propellants and have produced fuel cells, diaphragms and expeller bags of standout success *in action* against corrosion, oxygen and temperature extremes.

Call on the Goodyear Fuel Cell Engineer for information. Complete details available to properly cleared personnel. Write: Goodyear, Aviation Products Division, Akron 16, Ohio, or Los Angeles 54, California.

CompuDyne® Control

speeds research, development, production testing of missiles and rockets

In the race against time, CompuDyne Control is playing an important role in aircraft, missile and rocket development.

CompuDyne Control is available in a series of highly specialized, dynamic control systems. They are capable of programming severe ramp changes in even a complex group of test variables such as temperatures, pressures and flows of gases and liquids in tremendous or tiny volumes. Or, CompuDyne Control is capable of maintaining stabilized conditions despite the most severe transients.

Over two hundred CompuDyne Control installations are in operation. They include control of test facilities such as dynamic structural loading, engine performance, missile accessory, hot fuel flow, supersonic and hypersonic wind tunnels and dynamic environmental chambers.

Application of CompuDyne Control Systems is based on analog simulation of the systems and the test process. All systems are furnished on a guaranteed performance basis.

CompuDyne Control is a tradename of cdc control services, inc.

Write or wire for informative 24-page bulletin entitled, "Valid Data . . . economically produced." Ask for Bulletin G-102.

APS operation is initiated with ignition of an acceleration cartridge (11) providing direct energy to the turbine (1). Simultaneously, ignition of the main cartridge (12) builds pressure in the fuel cylinder piston (8) initiating decomposition of the monofuel thus forced into the decomposition chamber (10). Hot gas from decomposing monofuel drives the turbine—maintains pressure in the fuel cylinder (9).

At 65,000 rpm, the turbine requires a single stage reduction gear (2). At 24,000 rpm, it operates as a direct drive and gear weight is eliminated. Shaft speed is maintained constant by a load-biasing alternator (4) controlled by a frequency detector (7) that picks up a signal from output alternators (3). These alternators receive drive power directly. Reduction gearing (6) is required for the hydraulic pump (5).

'HIS CUTAWAY SHOWS HOW . . .

)esign Simplicity of Missile Accessory Power System ;ontributes to Light Weight and High Reliability

;ompletely self-contained, General Elec-ric's new accessory power system features teady-state monofuel decomposition, re-luced complexity, simplified operation, nd a high degree of reliability.

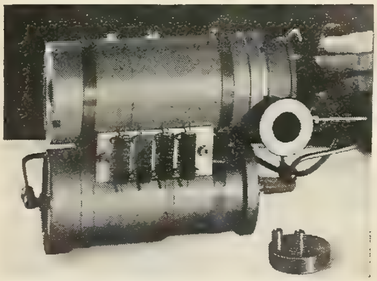
;OOTSTRAP FUEL DELIVERY reduces sys-em weight and complexity by eliminating ieed for fuel pumps, pressurized air or itrogen bottles, and similar equipment. Vithin the fuel storage cylinder, a step iston pressurizes the monofuel to pro-ide a constant flow to the decomposition hamber.

ORQUE MODULATION, accomplished y a load biasing alternator that com-ensates for changes in load demand, liminates valve regulation of fuel or hot as flow—offers precisely controlled speed.

The model illustrated—rated at 4.5 gpm, 2200 psi hydraulic power, 1 kva of 400 cps and .1 kva of 2400 cps alternating current —provides frequency control within ±1 percent and voltage control within ±5 percent without the added weight of a regulator.

DESIGN FLEXIBILITY, highlighted by an easily modified fuel capacity and a compact arrangement of easily interchanged hydraulic and electric components, permits ready adaptability to a wide range of outputs and duty cycles—minimizes size, weight, and complexity of reduction gears.

For more information on how this modular system can fit your application, mail the coupon at right or contact your General Electric Aviation and Defense Industries Sales Office.



Thirteen inches long, ten inches high, five inches wide, thirty pounds including fuel, APS reaches rated output in one-half second.

Manufactured by General Electric's Aircraft Accessory Turbine Department, Lynn, Massachusetts.

HIGH-STRENGTH ALUMINUM CASTINGS

He's saving your machining time!

Defective aluminum castings in your machine shop send time and money down the drain. The total loss in machining, inspection, handling, and paperwork often goes far beyond the price of the casting.

You can cut rejects and stop losses by buying dependably sound castings from a reliable source. Companies using aluminum castings from Brake Shoe's Light Metals Department have practically eliminated reject problems. One aircraft company cut rejects on specific castings from 35% to less than 5%. A missile maker cut rejections to less than 1%. Another company, which statically tests one casting out of every lot, reports no rejects to date.

Brake Shoe produces sand, shell, and plaster mold castings, from a few ounces to 500 pounds, in high-strength and standard alloys. Government certified heat treat, Zyglo, and X-ray insure complete soundness. Send drawings of your problem parts and our engineers will be glad to show how Brake Shoe's more than 50 years' experience in producing dependable castings can save time and money in your plant.

Guaranteed Properties in Highly Stressed Areas

cover picture:

Pattern for tomorrow! Caught in the sunlight, these stacked Nike *nozzles were photographed by m/r Associate Editor Seabrook Hull at Diversey Engineering Co. in Chicago. They symbolize much that is peculiar to missiles. Starting as heavy steel forgings, they have been machined down to less than one-half of their original forged weight in just a few minutes. Other missile metals run the gamut from aluminum and titanium, through the stainless steels and on to nickel-cobalt alloys, columbium and molybdenum. It is missile materials such as these that this issue of m/r emphasizes.*

Big Nozzles for Big Rockets

Behind the tailstock you see a Diversey craftsman ready to take a cut that will trace the bottom flange and taper of the O.D. of the nozzle. As nozzles go, this one is big . . . real big. It is the nozzle for one of the large rocket motors.

At Diversey you have the LARGEST FACILITIES exclusively devoted to your missile metal machining problems. You work with fast, precise and progressive technical people who know what works and what won't. Bring your big missile problems to Diversey.

HYDROSPINNING NOW AVAILABLE

A new Hydrospinning Division has been formed at Diversey which uses the latest and largest equipment to produce intricate missile parts.

Why all the Hemming and Hawing?

Five months have passed since *Sputnik* I. Yet the United States still doesn't have a space flight program. Bureaucratic complacency continues to hamper our missile and rocket efforts.

The basic problem appears to be lack of leadership at the top. No high-ranking administration official has spelled out what this country will attempt in the fields of missiles and astronautics.

Perhaps the main problem is that our political leaders cannot yet visualize the implications, the rewards and the value of space flight. Furthermore, they are still arguing whether space flight should be conducted under civilian or military auspices. Undoubtedly, a full-fledged attempt to explore and conquer space must be considered as a joint scientific-military venture.

Numerous space flight proposals from individuals and from industry have been submitted to the three services. Even our Vice President has been pleading with the National Security Council to rush approval of a moon rocket. The Vice President has reviewed such plans with Douglas Aircraft scientists, who are building the *Thor* missile. The Air Force hopes to use the *Thor* as the first stage for a moon rocket. But no one has yet attempted to coordinate all these proposals. No one has been authorized to do so.

Let us keep in mind what the Russians think about astronautics. They are convinced that apart from its purely scientific interest, space travel probably will be of practical value, although at this stage, they say, it is difficult to specify in what way. They point to the fact that the planets and their satellites are an inexhaustible source of mineral wealth which must be studied and utilized for the well-being of mankind.

Red officials say the Soviets will build interplanetary stations and spaceships in order to uncover the secrets of the universe and extend the domain in which human reason reigns over the elements.

We do not recall ever having heard similar remarks from any Administration official in this country. The lack of enthusiasm has been discouraging, not only to the American people, but to the entire Free World. Our efforts have been small, aimless.

Interservice rivalry is worse than ever. It has been thrown wide open again by Missile Czar William Holaday. All three services have been invited by Holaday to submit their missile proposals. This invitation automatically cancels past agreements to divide up missile development.

As a result, the Army has submitted plans to build an intercontinental ballistic missile, in direct competition with the Air Force's 5000-mile *Atlas* and *Titan* missiles. The invitation immediately spurred the Air Force to submit a proposal to build another ICBM—a solid-propellant vehicle to replace the programmed *Atlas* and *Titan*.

The ironic symbol of complacency in our bewildered astronautics efforts is the also-ran success of the Army-launched *Explorer* satellite. This belated achievement was proof that we could have launched a satellite a long time ago. Unquestionably, we have the technological capability to launch other, more sophisticated space vehicles.

What are we waiting for? The Administration must take the blame for the lack of planning and the failure to get a national space flight program off the ground. If we wait much longer the result could be fatal to us as a nation.

DEW LINE—Filtron as subcontractor to Western Electric Co., engineered, built and delivered on time **ALL** RF interference suppression components used on the DEW Line

Visit our Booths 1502-1504 at the IRE Show

FILTRON

The leader in RF Interference Suppression Engineering can help speed your Missile Program

Filtron's Field Engineering Division, the most experienced in the world on RF interference suppression . . . have played major roles in the following programs:

DEW Line • Atlas • B-58 Hustler • Falcon • Redstone Talos • Titan • Atomic Subs • Bomarc • Jupiter-C And other major classified programs.

Experience gained in the successful RF interference suppression programs from these weapon systems, is available now to manufacturers of missiles and advanced weapon systems wishing to augment their engineering manpower.

Filtron, and Filtron alone, has developed RF interference suppression requirements and solutions for missiles, block houses, test stands, launching sites, checkout equipment, telemetering and associated electronic systems. Frequency ranges from 30 cycles to over 10,000 megacycles.

Our missile engineers will gladly discuss your missile project requirements at your convenience.

Filtron's mobile RF interference laboratory at Convair's Atlas missile test stand.

CARDOX CENTRAL COMPRESSION SYSTEMS

CARDOX CORPORATION
HIGH PRESSURE PNEUMATICS DIVISION
307 N. Michigan Avenue • Chicago 1, Illinois

DISTRICT OFFICES AND WAREHOUSES THROUGHOUT THE NATION
Western States Distributor: General Air Equipment
824 Hollywood Way, Burbank, Calif.

Backed by 20 Years of Research, Continuous Engineering and Production Manufacture!

CARDOX Central Compression Systems were perfected through the engineering and building of hundreds of compressors and their associated equipment, operating in the 12,000 psi range of high pressure pneumatics. In their most numerous use, these compressors supply the high pressure air used in mines instead of explosives to produce nearly 20% of all bituminous coal output of the U. S.

CARDOX Central Compression Systems are now supporting missile testing and are also used by manufacturers of missiles in their component testing.

CARDOX' experience in such varied high pressure pneumatic activities is unequalled. It is one reason why with CARDOX Central Compression Systems you have not just *low* maintenance, but virtually *no* maintenance needs at all.

U.S. AIR FORCE
THESE ENGINES ARE NOW IN PRODUCTION AT C. A. E.

. . . the T-37 Twin Jet Trainer with C. A. E. Turbine Power

Air Corps flight training routine took a significant step forward recently, when the T-37 twin jet trainer entered its Phase VIII testing at Bainbridge Air Base, Georgia. Twenty hand-picked officers embarked on a course known as PROJECT PALM, with the two-way goal of training for them, and suitability testing for the plane. This new high-performance ship advances the jet phase of fliers' training to an earlier stage in the training schedule, speeding the transition from propeller-driven planes to jets, with gains in both safety and economy. Twin J69-T-9 turbines by C.A.E. provide the power.

White areas show extensive use of magnesium, (see details below).

HOW ELEVATED-TEMPERATURE MAGNESIUM ALLOYS HELP BOMARC KEEP FIGHTING WEIGHT

Approximately 230 lbs. of magnesium is used in the airframe of the Bomarc, powerful surface-to-air missile. And for good reason: In each case, the specific application called for light weight and retention of strength, rigidity and other properties at elevated temperatures. The logical choice was sheet, extrusions or castings of elevated-temperature magnesium alloys.

EXAMPLES:

BODY. The body skin and doors of both nose and aft sections utilize 103 lbs. of HK31A sheet and castings. Resultant weight savings were 23 lbs., including a net reduction of 6 lbs. by using a magnesium casting for a door frame structure.

WING, FIN AND TAIL. 111 lbs. of HK31A sheet were used in the wing, elevators and elevator stubs, fin and rudder. All leading and trailing edges of control surfaces for wings and fin are HM31XA extrusions. Here another 8 lbs. were saved by using an elevated-temperature magnesium alloy.

These are but a few instances of how precious weight was saved in the Bomarc. For more information about the use of magnesium alloys in aircraft, rockets and missiles, contact the nearest Dow sales office or write directly to us. THE DOW CHEMICAL COMPANY, Midland, Michigan, Department MA 1407L.

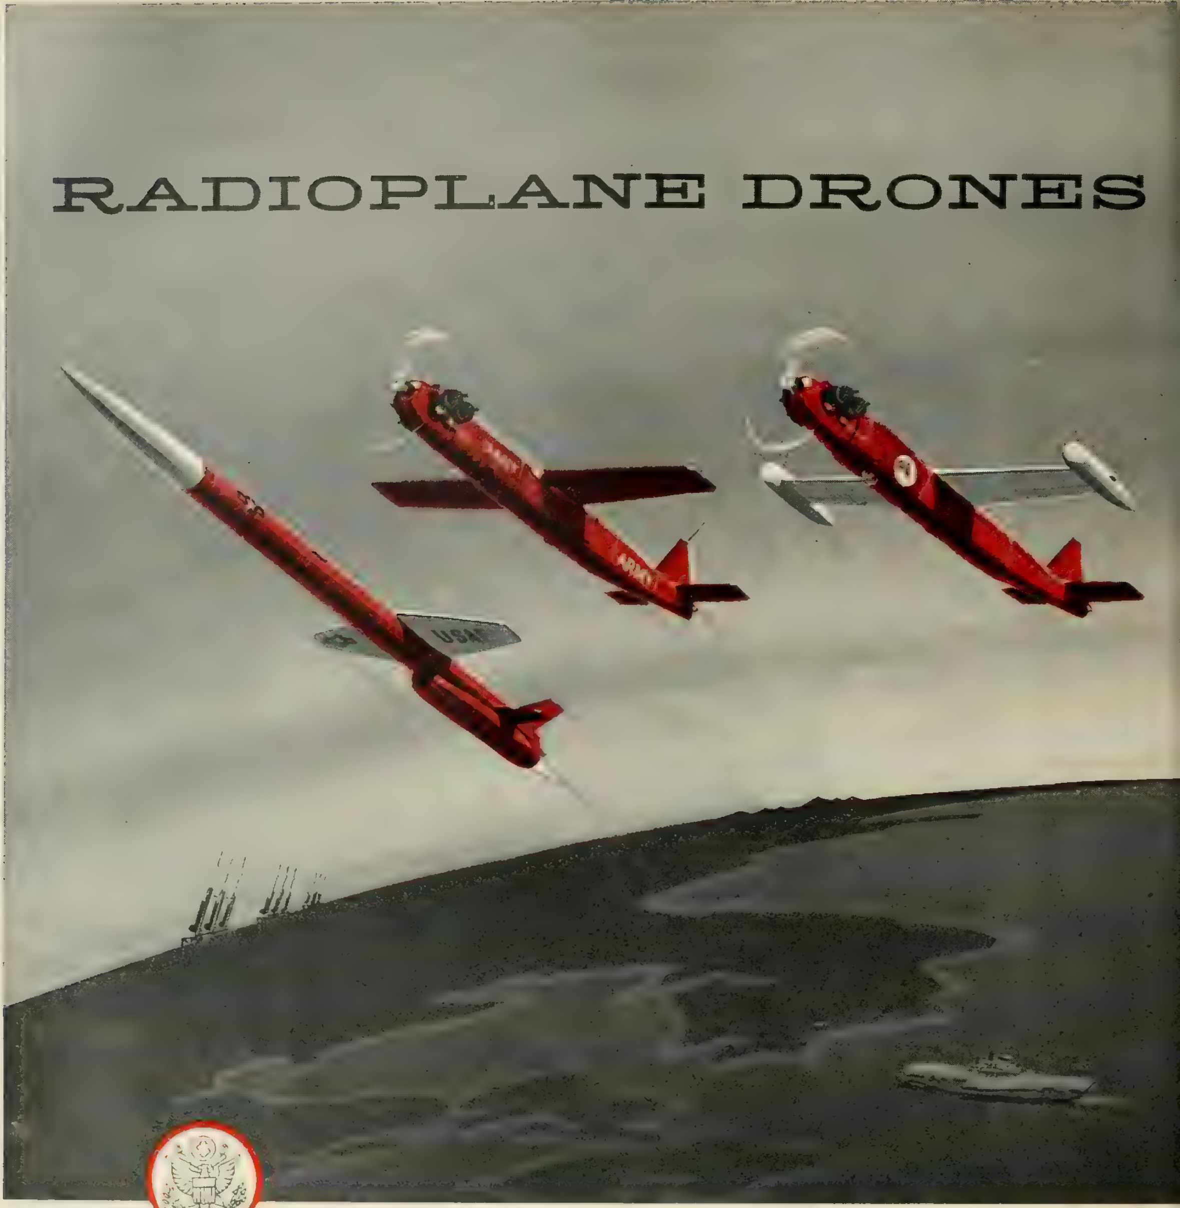
RADIOPLANE DRONES



ARMY

NAVY

AIR FORCE

WHAT IS RADIOPLANE?

Radioplane, a division of Northrop Aircraft, Inc., has been producing drones since 1938. And since 1938 Radioplane has concentrated its efforts almost entirely in the drone field, having produced and delivered tens of thousands of drones to all of the United States Armed Forces for defense training.

WHAT IS A RADIOPLANE DRONE?

A Radioplane drone is an unmanned aircraft designed to be flown by remote or self-contained control to perform a specific military mission at the lowest cost and with the highest efficiency. Every drone produced by Radioplane is developed to meet particular defense requirements which cannot be fulfilled by man-carrying aircraft.

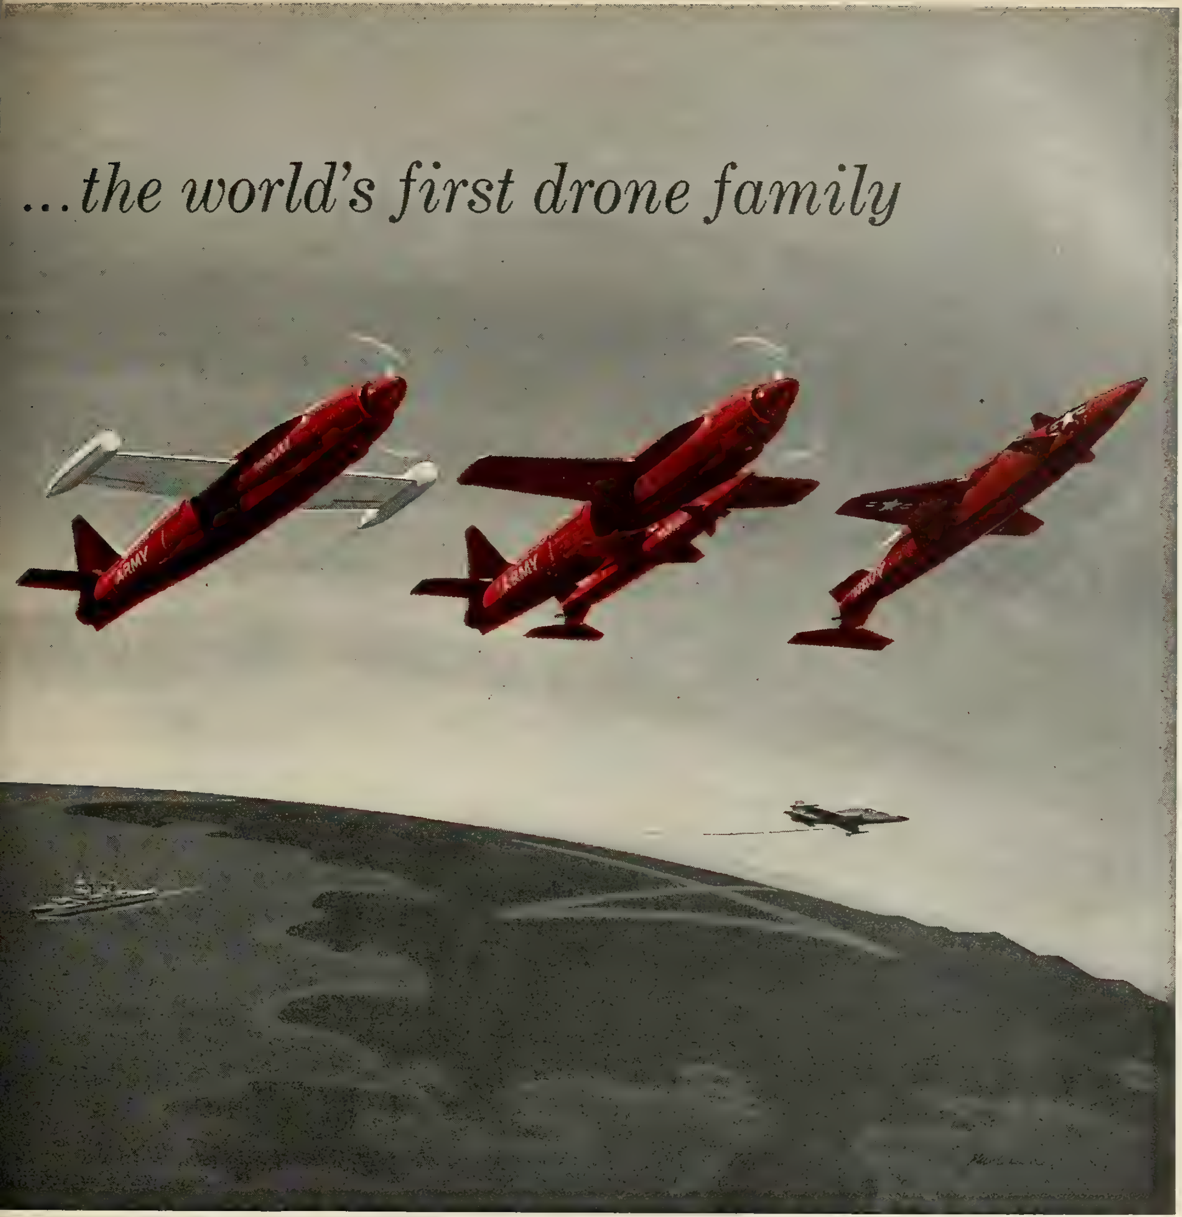
WHY A DRONE FAMILY?

Drones are required to serve as targets for the *evaluation* of modern weapons, in the *training* of weapon crews, and for aerial *surveillance*. Each of these vital areas requires a special drone application. For this reason, Radioplane has developed this family of drones (left to right):

XQ-4A . . . Evolving from the supersonic XQ-4, the Air Force XQ-4A is a highly sophisticated target drone designed to cope with the exacting and comprehensive requirements of evaluating the kill-ability of modern weapon systems.

OQ-19 TYPE . . . Standard radio controlled aerial target for all the military services, the tough, reliable and versatile OQ-19 drone is used all over the world as an economical training target.

SD-1 . . . Without endangering a pilot's life, the U.S. Army Signal Corps' SD-1 can be flown by remote control on photo



...the world's first drone family
ARMY
ARMY
NAVY

reconnaissance missions, returning within minutes with a photographic report of enemy activities.

RP-77D . . . Powered by Boeing's rugged 502-10 turboprop engine, the RP-77D provides high speed, and both high and low altitude performance at low cost for the training of gun and missile crews.

RP-77DL . . . The RP-77DL will carry the RP-76 target aloft for launch at altitude over the Army's Nike ranges, thus eliminating the need for diverting a manned plane and crew into a workhorse job.

RP-76 . . . (Shown attached to the RP-77DL.) The rocket powered RP-76 has very high altitude capabilities for training the Army's ground-to-air missile crews against fast, realistic targets.

XKD4R-1 . . . Designed for U.S. Navy fleet target air-to-air and surface-to-air weapon training, the XKD4R-1 rocket drone flies a pre-set course by programmed flight control.

* * *

Radioplane has been selected by the U.S. Army to provide complete *contractor operated flight services* at White Sands Proving Grounds, New Mexico. This service includes furnishing aerial targets, ground support equipment, and operational, training, and maintenance personnel.

GREER GO NO-GO TEST SYSTEM

Missile readiness at the launching site is assured when put through its paces with a Greer Go No-Go Test System. Take for example the above missile test facility recently completed for a leading manufacturer of missiles.*

This unique Go No-Go System automatically and accurately tests missiles off the production line. The system encompasses every type of missile test including fuel, pneumatic, hydraulic, electrical, mechanical—all equipment designed, developed and built right in the Greer plant.

The fool-proof test system programs and schedules 32 different inputs for Go No-Go readout, and self-checks each input for accuracy before the actual test. Its special and multiple circuits provide rapid determination and isolation of defective parts in the missile. In addition, the equipment signals accurate operation of its own test circuits and components. All test conditions, altitude, speed, pressure, temperature, etc., are simulated and accurately controlled to match those in actual missile flight.

Bring your out-of-ordinary missile test problems to Greer. At your disposal is Greer's vast test equipment experience and know-how, Greer's staff of creative engineers and skilled technicians—plus a fully-equipped plant to do the job for on-time delivery. For immediate action contact Greer.

**For details, contact Greer sales manager, test equipment division.*

letters

Credit to ABMA

To the Editor:

We were very pleased with the inclusion of the John Jagy article in your February issue. However, probably due to editorial space you condensed the introduction of the article and thereby made an error which I feel should be corrected.

In the introduction of the article as we sent it to you, we pointed out that the air bearing gyro was developed by the Army Ballistic Missile Agency. In your condensation of the introduction you left this information out and consequently gave the impression that we are claiming to have developed this very unusual instrument.

I feel that it would be only right for you to carry a correction . . . to give full credit to the Army Ballistic Missile Agency for their work and particularly to Dr. Walter Haeusserman, Mr Fritz Mueller, Mr. Henry Rothe and Mr. Wilhelm Angele, who headed up this splendid work.

I am sure that it is your intention to give full credit where credit is due to all who are responsible for making valuable contributions to America's missile effort.

Wise Men

To the Editor:

Your editorial in your December issue, "Let's Listen to the Wise Men," stated that: "Reports were written by Dr. Louis Ridenour urging a divorcement of research from engineering management." I would appreciate it very much if your office could send me complete reference to these reports. They should have application in management of R&D on range instrumentation.

Dr. Fred Hanson
Scientific Advisor
Integrated Range Mission Staff

Contact the Command Historian, ARDC, Andrews AFB, for copies of reports by the Ridenour Committee, which led to the establishment of ARDC.—Ed.

Space-for-Peace Plan

To the Editor:

In a recent issue of m/r you mentioned my proposal for an International Astrophysical Decade. Since the date and place of submission of this proposal was not mentioned, I wish to add this information here, together with a few comments.

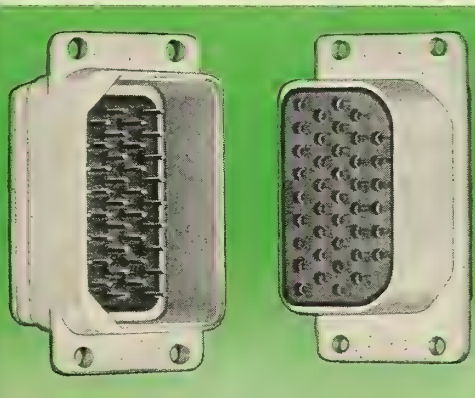
The proposal was part of a paper entitled "Instrumented Comets—Astronautics of Solar and Planetary Probes." It dealt with the analysis of lunar and heliocentric probes, their flight profiles, characteristics and mission assignments.

The paper was presented at the Eighth International Astronautical Congress in Barcelona, October 1957, and was submitted to the International Papers Committee long before the first Russian satellite appeared in the sky. In studying the practical and organizational problems of inner solar-systems research by artificial comets and its remoteness from immediate military significance, it appears to me that an international effort is the most attractive approach, similar to the IGY in spirit and purpose, but to be extended over a longer period of time in view of the duration of the missions and the cost of the experiments involved.

I also see in such a project a unique opportunity for astronautics to foster international cooperation and gradual development of a planetary perspective in the international public, a feeling which must become the foundation of future space operations if they are to be peaceful and constructive.

In my opinion, the Russian Government—much as it has exploited propagandistically its great achievement—has missed here a historically unique opportunity of genuine service to mankind—namely, to invite international astronautic cooperation of the type of the International Astrophysical Decade or comparable projects, because I am convinced that this is what most people on this earth would really welcome.

Instead, the Russian Government has called for a "race into space." The adjective "peaceful" was used by Mr. Khrushchev. However, the dangerous implication of the "race" concept is that in a race the partners *compete* rather than *cooperate*. Although noble competition is most desirable, it is, in view of



ANOTHER Bendix ACHIEVEMENT

A resilient insert rack and panel connector

Here is the new and improved Bendix Type SR rack and panel electrical connector with outstanding resistance to vibration. The low engagement force of this connector gives it a decided advantage over existing connectors of this type.

Pressurization is easily accomplished. The resilient inserts press firmly against the shell wall holding the contacts in exact position. Insert patterns are available to mate with existing equipment in the field.

Adding to the efficiency of this rack and panel connector is the performance-proven Bendix "clip-type" closed entry socket.

Here, indeed, is another outstanding Bendix product that should be your first choice in rack and panel connectors.

OUTSTANDING FEATURES

Resilient Insert • Solid Shell Construction • Low Engagement Forces • Closed Entry Sockets • Positive Contact Alignment Contacts — heavily gold plated • Cadmium Plate—clear irridite finish • Temperature range −67° to +250°F. • Easily Pressurized to Latest MIL Specifications.

ONE-PIECE WELDED CONE FOR THE HOT SPOT

This is the vital nozzle cone of the Martin Mace guided missile. American Welding was able to form it in one piece from ¾-inch plate (FS-1020) and arc weld the joint to produce a tapered cone with a major diameter of 25 inches and a minor diameter of 15 inches. After heat treating and X-ray testing, it proved to be better and more economical than nozzle cones produced by the previous method of forming in two halves.

If you require a circular product and it's metal — call American Welding first.

New Products Catalog. Write today for 20-page catalog of circular products which American Welding can form, weld and machine for you.

the existing international situation at least, unrealistic to assume that such important competition will stay in the realm of peaceful manifestations only.

Therefore, a call for international cooperation in the coming series of giant cosmic experiments is the only realistic approach if one really aims at peaceful execution of space exploration. We do not want to fire ballistic missiles across space, but forerunners of manned spaceships. Russia's lead will be short-lived—*sub specie aeternitatis*—and their leaders must realize this. Their opportunity for leading the world in astronautics, in a higher sense than purely mechanically, is gone forever. Our great opportunity is still ahead of us. Will we use it? I herewith renew my call—now post-*Sputnik*—for an International Astrophysical Decade.

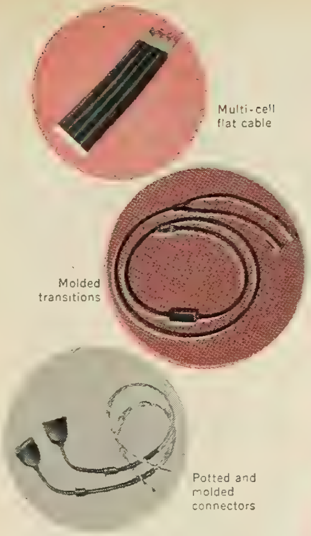
Bids Too Soon

To the Editor:

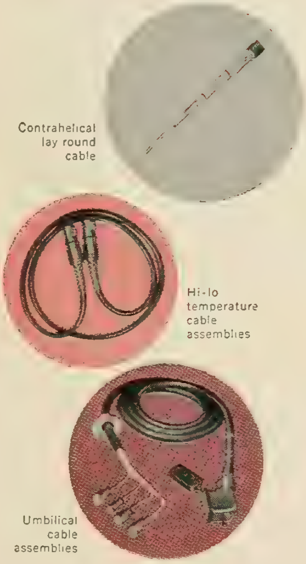
From Dec. 16, 1957 through Jan. 7, 1958, I worked on one of the new *Bomarc* launching installations, part of a $46,000,000 project recently announced by the Air Force. I was present at the opening of the bids on the first installation, to be located at the McGuire Air Force Base near Wrightstown, N.J., in Philadelphia on Jan. 7, 1958.

When I got back to Houston, the January issue of m/r was lying on my desk. It was devoted to "Ground Support Equipment," including, on page 78 and 108, concise, authentic information on the very problem I had been working on—*Bomarc* missile. Had I had this information one month sooner, it would



Now—a new electronic cable facility organized to fulfill *all* missile and aircraft cable demands. CABLE SYSTEMATICS at Robertshaw-Fulton assures orderly, scientific reduction of your complex wiring and connecting requirements to provide more reliable cable systems *faster* and at less cost.

NEW METHODS
CABLE SYSTEMATICS
NEW FACILITY



Contrahelical lay round cable
Hi-lo temperature cable assemblies
Umbilical cable assemblies

At Robertshaw-Fulton, experienced creative cable specialists systematically assume responsibility for cable system design, fabrication, installation, checkout and field maintenance.

However uncommon your cabling requirement . . . whether you're in the blueprint stage or beyond . . . there's an R-F Cable Systematist waiting to talk to you. Contact him today at—KEYSTONE 5-8151 or TWX-AH9045.

Hamilton Standard Engaged in Electronics

To the Editor:

In view of the overall excellence of your magazine, it was quite surprising to find that your listing of companies engaged in electronic and missile activity failed to mention us (page 76, Feb. issue).

Hamilton Standard division of United Aircraft Corp. has been engaged in the design, development, testing and production of electronic controls since 1944. Today, the Electronics Department is established as a virtually autonomous unit at Broad Brook, Conn., to concentrate on the design and development of total weapons systems and airborne electronic systems for both aircraft and missiles. Except for missing us, I think that you have a most excellent magazine, and in this I echo the sentiments of all our technical staff. Keep up the good work.

Roy E. Wendell
Public Relations
Electronics Department
Hamilton Standard Div.
United Aircraft Corp.
Broad Brook, Conn.

Sorry. Hope this takes care of the omission.—Ed.

Standardizing Terms Needed

To the Editor:

First of all, I would like to express appreciation of the fine coverage of the field from A to Z. I am a charter subscriber and have a complete file of m/r, to which I frequently refer.

In a recent issue of m/r, Mr. Arthur F. Joy of Raytheon Manufacturing Co. inquired as to the difference between a ballistic missile and manned and unmanned rockets and missiles, spaceships, and guided and unguided missiles and rockets.

I would like to recommend to Mr. Joy and others interested in these terms, the U.S. Air Force Dictionary published in 1956 by the Air University Press, Woodford Agee Heflin, editor. I am employed as an engineering publications editor, Service Publications, Convair (Fort Worth), home of the B-58 *Hustler*. This dictionary is used as first authority for the words it defines.

A dictionary of aeronautical and astronautical words and terms that is frequently brought up to date will find a very useful place in the industry.

C. Roger Cripliver
4928 Rector Ave.
Fort Worth 15, Tex.

Fine idea. Perhaps this should be undertaken by the IAS or ARS.—Ed.

What's new in TITANIUM alloys:

Advances in aviation technology have happened so swiftly that engineering materials can no longer be selected for their broad use, but rather for the specific tasks they perform.

Today, in the face of tight budgets, the *right* material is the only sound solution to any given problem. Patch-work design, engendered by second-best materials, can only result in second-best aircraft and missiles in uniquely critical times.

To meet the constant tightening of design requirements, Titanium Metals Corporation of America has opened wide new areas of alloy development. This means: heat-treatable bar stock with *guaranteed* capabilities; higher temperature ceilings; broad new strength ranges.

Q. Are the guaranteed heat-treat alloys new?

A. The alloys are not. They have a production history of four years and a wealth of technical data to support them. Recent development of their full heat-treat capabilities has produced such dramatic results that they are considered new.

Q. What are the heat-treat alloys?

A. Ti-155A (5.5% aluminum; 1.5% iron; 1.5% chromium; 1.1% molybdenum) the highest strength bar and forging stock commercially available; and Ti-6A1-4V (6% aluminum; 4% vanadium), which in the annealed condition has already won wide designer confidence. Samples of *guaranteed* minimum heat-treat capabilities show:

	Ti-155A	Ti-6Al-4V
Section size: Up to 1"		
Ultimate Tensile Strength (psi)	170,000	160,000
0.2% Yield Strength (psi)	155,000	150,000
Elongation, % in 4D (Long)	10	10
(Trans)	8	8
Reduction in Area, % (Long)	20	25
(Trans)	15	20

Detailed information on Ti-155A is presented in a 20-page TMCA Engineering Bulletin. Additional data on Ti-6A1-4V, such as fatigue characteristics and guaranteed heat-treat capability are also available.

Q. Are there other new alloys?

A. The leading alloys nearing commercial volume are Ti-8A1-1Mo-1V, a bar stock offering excellent elevated-temperature creep strength to 1000°F, and Ti-4A1-3Mo-1V. The latter, now being produced and evaluated by the Department of Defense sheet rolling program, is designed to fill the need for high strength sheet alloy which can be formed in solution-treated condition and aged to strengths of 175,000 psi. When compared to other high-strength titanium alloys, Ti-4Al-3Mo-1V combines improved formability with outstanding elevated-temperature strength and stability.

Typical Properties — Ti-4Al-3Mo-1V

Condition	Temp. °F	0.2% YS psi	TS psi	Elong. % in 2"
Solution treated	Room	94,000	135,000	14
Solution treated and aged	Room	163,000	175,000	5
	200	142,000	169,000	8
	400	126,000	152,000	8
	600	111,000	140,000	7
	800	98,000	127,000	9

Q. How will these alloys raise temperature limits?

A. Ti-8Al-1Mo-1V is a good example. Although its short-time elevated temperature tensile properties are similar to Ti-6A1-4V, this new alloy offers as much as a tenfold increase in creep strength between 600°F and 1000°F, as shown:

Creep Comparison Between Ti-8Al-1Mo-1V and Ti-6Al-4V

Alloy	Annealing Treatment	Temp (°F)	Stress (psi)	Time (Hrs.)	Def. (%)
Ti-8Al-1Mo-1V	1400°F (24 hrs) AC	850	50,000	300	0.42
Ti-6Al-4V	1300°F (2 hrs) AC	850	50,000	300	3.6
Ti-8Al-1Mo-1V	1400°F (24 hrs) AC	950	15,000	300	0.16
Ti-6Al-4V	1300°F (2 hrs) AC	950	15,000	300	4.3

Now being evaluated by engine manufacturers, Ti-8A1-1Mo-1V appears to answer the need for light-weight strength at steadily higher temperatures. Data on both Ti-4A1-3Mo-1V and Ti-8A1-1Mo-1V alloy are available from TMCA.

All these excellent new alloys have boosted still higher titanium's major advantages of light weight, great strength, superior temperature characteristics, and outstanding corrosion resistance.

To guarantee ready availability of this important engineering metal, TMCA has opened in Toronto, Ohio, the world's first plant designed and instrumented solely for rolling and forging titanium to aircraft quality standards.

This plant guarantees more titanium at better delivery dates than ever recorded in the history of titanium metal.

A series of outstanding technical bulletins is available from TMCA, 233 Broadway, New York 7, N. Y. This literature is yours for the asking.

TMCA hopes to serve you.

HALLAMORE PHASE-LOCK DISCRIMINATORS

ELIMINATE SYSTEM ERRORS... AFFORD ECONOMY AND SPACE SAVING ADVANTAGES—

This Hallamore developed building-block type FM instrumentation system is designed to condition and calibrate signals from any combination, or multiples, of the following transducers: potentiometers, flow pickup, bridge, thermocouple, or differential transformers. Hallamore manufactured elements in the system include DC amplifiers, SCO, summers, universal calibrator, calibrator test instrument, timing system and the discriminator station. Hallamore phase-lock discriminators, Model 0162, reduce subcarrier frequency information to output data, relatively undisturbed by noisy signals which contribute to the inefficiency of pulse counting type discriminators.

Designed around a concept entirely new to the telemetry field, the Model 0162 phase-lock discriminator eliminates signal suppression by noise, non-linearity by filtering, and thresholding at low signal-to-noise levels. In addition, the unit occupies less space, reduces overall system cost, and assists in the simplification of operational procedures. For complete specifications and operational data, write Hallamore Electronics Co., Dept. 87, 8352 Brookhurst Avenue, Anaheim, Calif.

Modules never become obsolete—As needs change simply regroup present modules or add new ones. Your system is always up-to-date at minimum cost and engineering. Internal construction is also modularized for maintenance ease.

Fully transistorized circuitry—All transistor circuits on encapsulated plug-in cards

- gives increased reliability
- reduces power consumption
- lowers heat dissipation
- permits miniaturized packages
- eliminates radio noise and line transients

Many new advanced application features and specifications—The result of thousands of applications and field experience from more than 2,500 digital instruments and systems.

- Now you can "read through" superimposed ripple on DC—and know its magnitude—by using the calibrated digits gain control located on the front panel. Steps by 1, 2, 3, 4, 5, 10, 50 and 100 digits.
- Controlled ranging by switch position—"automatic," "hold," "manual"—enables operator to manually control range position but still select automatic ranging in the same instrument.
- Power control for "on," "off," and "stand by" positions.
- Wider dynamic range covering all voltages from 100 microvolts to 1,000 volts, resistance range from 10 milliohms to 10 megohms—in single instruments.
- Input power frequencies from 50 to 400 cycles.
- New balance logic for faster down ranging.
- Automatic AC ranging from 30 to 10,000 cycles.
- Controlled stepping switch drive increases switch life by a factor of five—proved by actual tests.
- Meets many MIL specifications.

MAXIMUM FLEXIBILITY

1. Universal 3½" x 19" x 12" chassis with mounting hardware for any rack.
2. Digital outputs may also drive storage matrices, go-no go comparators, and other auxiliary modules.
3. All contacts readily accessible at rear panel on connectors.
4. With auxiliary plug-in modules, digitized data is provided in printed form, punched cards or tape with no modification to basic measuring instruments.

DIGITAL OHMMETERS

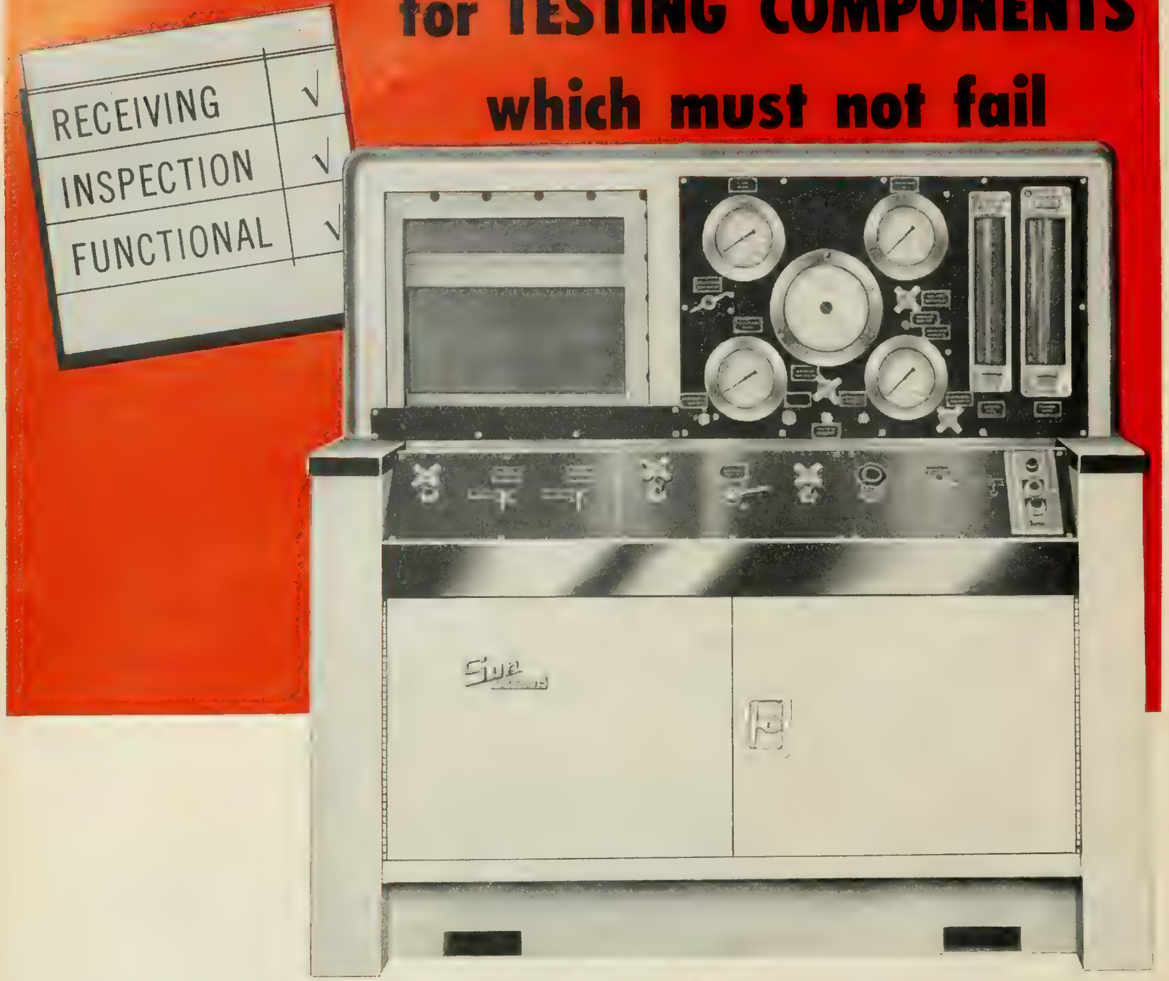
for TESTING COMPONENTS which must not fail



Hydraulically powered air compressors, accumulators and various other components of an airborne hydraulic system are performance-proven with this Sun-designed High Pressure Pneumatic and Hydraulic Test Stand, Model LS-244.

The stand provides means for both dynamic and static hydraulic system testing as well as a pneumatic system with all instrumentation and controls to measure pressure and flow at the inlet and outlet ports of the device under test.

Dry and submerged tests are performed. For operator safety, components are tested behind bullet-resistant glass. The stand is not, however, designed to perform destructive or bursting tests.

Sun engineers can help you with your testing problems whether they be hydraulic, pneumatic, electronic, or any combination of the three. A call to your nearest Sun Aeronautical Division will bring an immediate response.

GENERAL SPECIFICATIONS

Model No.	LS-224
Nomenclature	High Pressure Pneumatic and Hydraulic Test Stand
Purpose	Hydraulic Components Tester
Dynamic Hydraulic System	Remote supply, delivers 5 gpm at 3000 psi
Static Hydraulic System	Remote supply, delivers 1 gpm at 100 psi boosted to 20,000 psi by air-operated boost pump
Pneumatic System	100 psi
Controls and Instrumentation	Circuit controls, pressure gages and flowmeters. Illuminated instrument and Control panel recessed and angled for easy viewing and operation

400-foot capacity
high speed camera

FAIRCHILD'S high speed Motion Analysis Camera, now with a 400-foot film capacity, is especially useful for work where reloading is impractical, or where longer inspection periods are required. Here's why:

Stop-start operation at all speeds, *exclusive* in Fairchild cameras, permits multiple bursts without continuous exposure of the entire spool. The camera can be loaded in daylight with either black-and-white or color film. You can select from a series of quickly interchangeable motors providing ranges of film speeds from 10-80 pps to 800-8000 pps. Lenses from 3.7 to 152 mm. are available, in focusing mounts with bayonet lock. Weight is 24 pounds.

For more complete information on the HS401 Camera and its many useful attachments . . . plus the latest data on high-speed photography . . . mail the coupon today.

- To develop films quickly, use the Fairchild "Mini-Rapid 16" Processor. This completely automatic unit can develop and dry 100′ roll of film, ready for examination and screening, within 20 minutes. Adjustments for differences in exposure or other variables can be made during development.

Honeywell Rate Gyro
Type JRT
Shown ½ size

First test firing of the ATLAS ICBM at Cape Canaveral, Florida, June 11, 1957.

Flight Control for the ultimate weapon

Three Honeywell Rate Gyros, Type JRT, provide missiles with precise three-axis directional stability and are currently being supplied to the ATLAS missile program.

The Type JRT is a highly accurate precision instrument for measurement of absolute rates of rotation in inertial space. Viscous damping is electro-mechanically controlled to maintain a constant damping ratio over the entire operating temperature range of −65°F. to +175°F.

This new Honeywell Rate Gyro is designed expressly for flight control of missiles and flight instrumentation in missiles and aircraft where severe ambient conditions prevail . . . and at the same time where low threshold, minimum hysteresis, excellent linearity, high natural frequency and ruggedness are essential.

Honeywell inertial components and engineering experience are available to assist in the solution of your Gyro system problems. Write for Bulletin JRT . . . Minneapolis-Honeywell, Boston Division, Dept. 45, 1400 Soldiers Field Road, Boston 35, Mass.

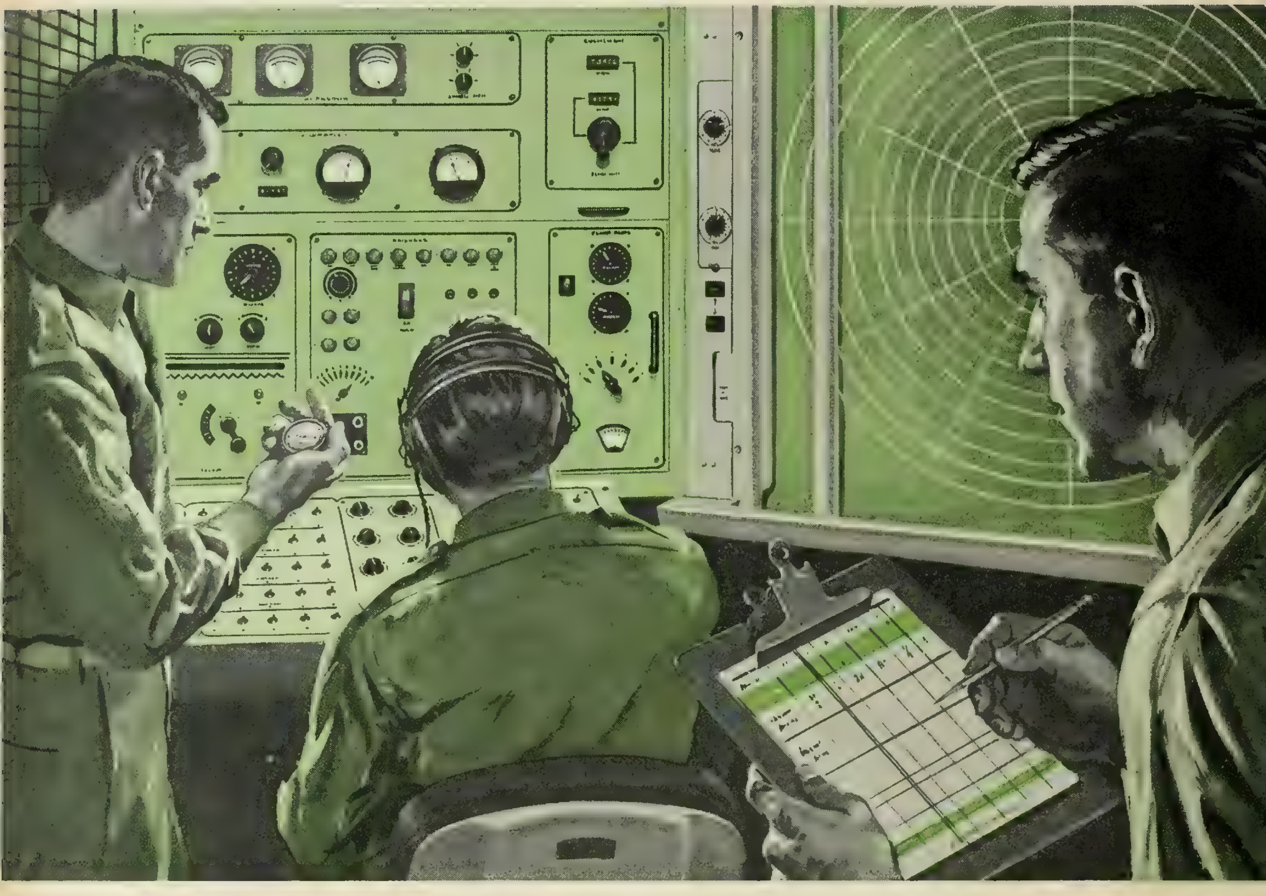
If your problem calls for

MISSILE TRAINING



Link's Design, Engineering and Production Abilities Provide the Answer

Link-designed electronic equipment provides a reliable and economical means of training missile crews—long before costly installations are put into actual operation.

Link is established as a leader in the development of a wide variety of electronic gear. Equipment delivered includes:

- Go-No-Go Test Equipment
- Component Assemblies
- Missile Training Equipment
- Optical Systems
- Computers
- Simulators

Efficient production, alert management and modern research facilities on both coasts insure that every Link unit meets the most rigid specifications.

Link's team of engineers, accustomed to solving unusual and difficult problems, is backed by a production staff skilled in custom-assembly of intricate equipment for military and civilian needs.

Take advantage of Link's long experience in the electronics field. For complete information, write or call Jack Ritchie, Engineering Sales, Binghamton 3-6311 (Ext. 277). A brochure of our facilities is available on request.

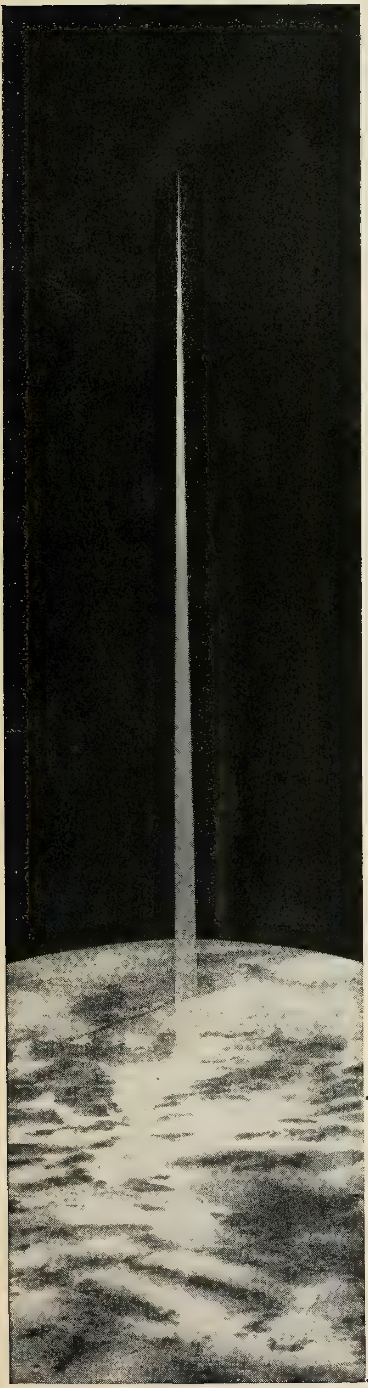
Engineers: Act NOW to move your career years ahead, with the company building the power plants for

ATLAS · THOR · JUPITER · REDSTONE



Even as you read this, ROCKETDYNE is testing the mighty propulsion systems to launch the major missiles of the Free World. There's a unique excitement in the work. It marks a turning point in history. Man is beginning to conquer space.

POWER—AND STILL MORE POWER

At ROCKETDYNE's 1600-acre Propulsion Field Lab. near Los Angeles, and in the new test stands at the Neosho plant in Missouri, the thrust ratings make previous engine development look puny by comparison. And still the demand is for even more power—power that gulps hundredweights of fuel per second—power that must be controlled with the delicate accuracy of a high precision instrument.

NEW WORLD OF ENGINEERING

This is a major new industry. The men who run it are professionals of an entirely new breed. Among them are mechanical and chemical engineers, physicists, dynamics specialists, creators of control systems of all kinds, heat exchange experts, research men, test engineers capable of handling the mightiest engines ever built. Every day two miles of data tape come from the test stands to teach them something new. If the state of their art could be put into print right now, the book would be out of date in a week.

At ROCKETDYNE you'll work with methods and techniques years ahead of conventional industry. You'll be a fully informed partner in major projects. Your advancement will be limited only by your own ability, and our educational refund plan can step up your qualifications for positions right at the top.

YOUR CAREER CAN GROW FAST IN THIS FAST-GROWING FIELD

NORMAN C. REUEL received his BS in Chem. E. at Georgia Tech. and an MSAE at Cal. Tech. specializing in jet propulsion. Following rocket and radar development in the Navy he joined North American Aviation in 1946 as a research engineer. Now assistant chief of design and development, he also finds time to relax at his ranch home, bowl, golf, and play tournament bridge.

PAUL D. CASTENHOLZ, Pacific combat veteran, graduated B.Sc. (Eng.), UCLA 1949. From research engineer his grasp of rocket engine work raised him through a supervisory post in experimental development to assistant group leader in combustion devices, and then to group leader of experimental engines. Recently completed requirements for his MSc. Relaxes with hi-fi, fishing and back packing.

NEWS AND TRENDS

U.S. To Launch Nine Satellites By 1959

Army gets approval for five more *Explorers*; *Vanguard* 'grapefruit' still bogged down

by Erik Bergaust

The Army has been authorized to send aloft another five Explorers, but this venture is not scheduled as part of any national space flight program. At the end of February no steps had been taken in Washington to finalize a space flight agency. Missiles & Rockets **questioned a number of the nation's top missile experts as to whether they had been invited or approached by the Defense Department for participation in a national space flight program. The answer was negative in every instance.**

Frustrated Washington missile officials have expressed the hope that the United States will launch successfully nine satellites by 1959. Explorer II is scheduled to be fired this month. The Vanguard grapefruit carrier, after having been bogged down in technical complexities, was set for another try as m/r went to press. The International Geophysical Year already is nine months old.

In secret testimony before the House Appropriations Committee last month U.S. satellite officials learned that the United States has gained much information from the two *Sputniks*. In fact, the U.S. IGY Committee appeared to have used this argument as a stepping stone to get more money "to expand their studies." Hugh Odishaw, executive secretary of the U.S. IGY program indicated the American scientists gained information from the *Sputniks* without any aid from the Reds. The request for an additional $2,100,000 in "emergency funds" was made.

On the other hand the U.S. IGY committee last month stated that none of the information offered by the Russians on the first two *Sputniks* was new. The first official Red report does not contain any of the measurements made by instruments in the satellites. It lists only the type of measurements made, the equipment carried and orbit data from the ground tracking stations.

Data from *Sputnik* I will not be available before June and data from *Sputnik* II not before July.

The report was sent by the USSR on January 27 and received at the IGY headquarters in Brussels on February 11.

Orbit velocities and altitudes corresponded with those reported by tracking stations in the United States.

The five satellites scheduled for launching by the Army this year will be put into orbit by the *Jupiter*-C vehicle.

Explorer II will incorporate a tape recorder, allowing storage of information until it passes over a ground receiving station, at which point the stored data will be transmitted to earth.

As m/r went to press, there were reports in Washington that a 500-pound satellite would soon be launched by the Army, using a *Jupiter* IRBM as the first stage.

Red Moon Rocket on Launching Pad?

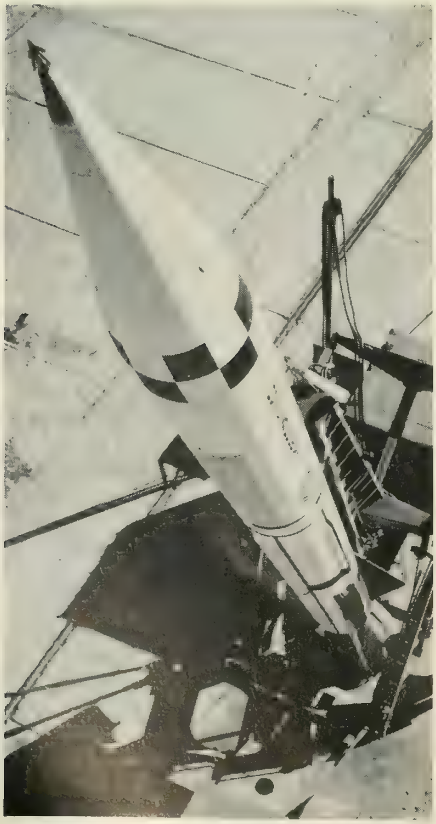
European scientists who visited the USSR recently confirmed to m/r that the Reds are pushing hard to launch their first moon rocket. After a relatively "quiet" period with no Sputnik *launchings and very few IGY sounding-rocket firings, the Reds apparently are concentrating their efforts on Project* Boomerang.

As reported in last month's issue of m/r, the Reds' effort to place an instrumented vehicle in an elliptical orbit around the moon (Project Boomerang*), has been placed under the direction of Prof. G. A. Chebotarev. One year ago Chebotarev authored a paper on the method of placing a payload of 110 to 220 pounds in a lunar orbit.*

From reliable sources overseas, m/r has learned that the Russians have conducted several unsuccessful satellite launchings and that they already have tried—unsuccessfully—to reach the moon. Nevertheless, the general feeling is that they will get a moon rocket under way before the United States. However, some Russian scientists have expressed their concern over the difficulties involved in launching a rocket around the moon. Prof. V. Sharonov, writing in Izvestia, *says that "the task of orbiting an artificial satellite around the moon is very far from the practical capabilities now available to us." One should remember, however, that Russian scientists less than a year ago also warned about the difficulties of launching satellites such as* Sputnik *II.*

eb

U.S. MISSILES in the NEWS

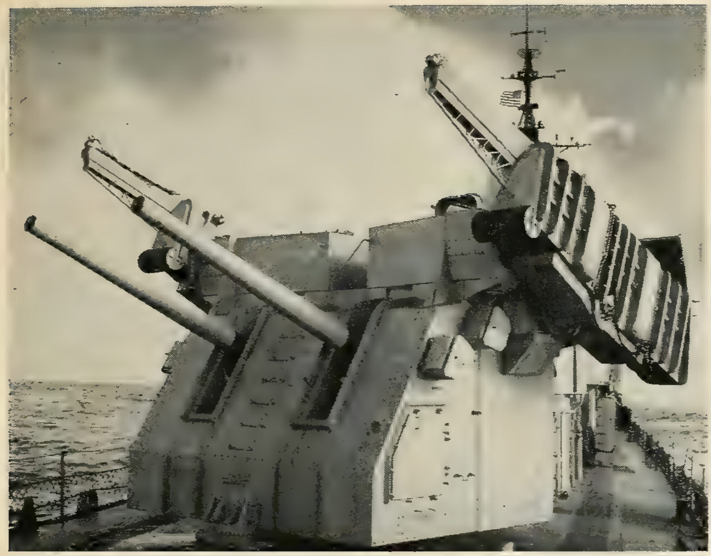


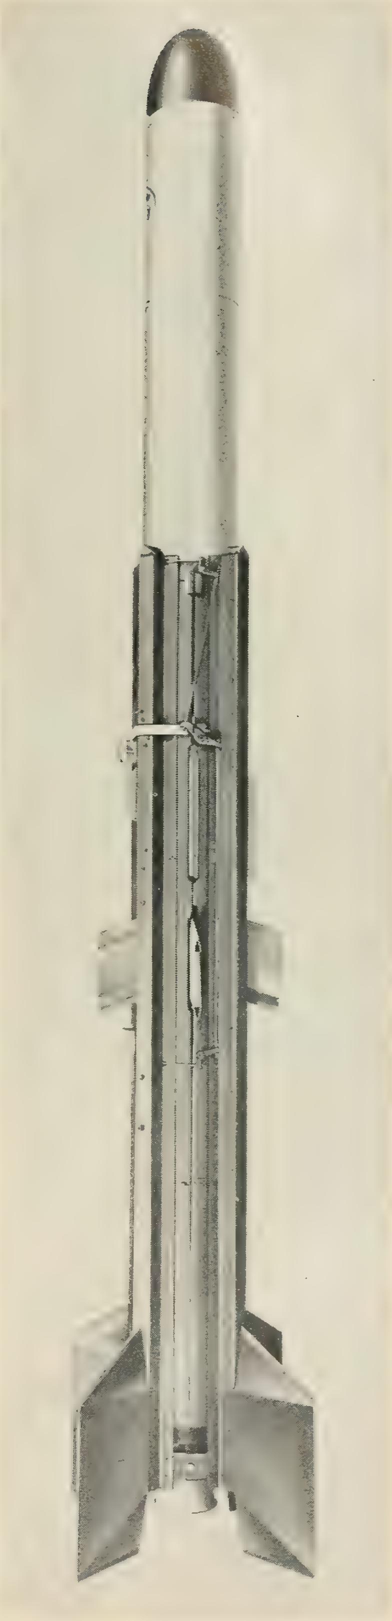
THIS NATION'S largest solid-propellant missile, the *Sergeant*, is now in production for the U.S. Army, with first deliveries to troops expected in the near future.

A second generation missile, the *Sergeant* will succeed the four-year-old *Corporal* missile, with incorporated improvements over the *Corporal*'s thrust and accuracy. The anticipated range of the thirty-foot-long missile will be close to 200 miles compared with the *Corporal*'s 75-100 mile range. An operational battalion for the *Sergeant* is expected to be under 200 men.

All system elements for the missile have been designed for portability and mobility incorporating government-furnished equipment for transportation vehicles. Guidance is achieved by an inertial system requiring only a programmed pitch control for range variation. This makes the weapon extremely ideal for battlefield operation. In contrast, the *Corporal* is controlled by radio signal during its powered flight making it susceptible to enemy countermeasures.

The *Sergeant* is the latest member of a family of Army missile designed and developed by the Jet Propulsion Lab. These include *Private* A, *Private* F, *WAC Corporal, Corporal,* and the *Sergeant*. Next in the series will be the *Pershing* 500-mile solid-propellant rocket. The Sperry Gyroscope Co. will be responsible for production of the complete *Sergeant* missile system.





A RAT is the Navy's latest defense against enemy submarine "wolf packs." The new rocket-assisted torpedo, which is launched from destroyers in pursuit of enemy subs, is expected to be in fleet operation by the end of this year.

The weapon system consists of a standard homing torpedo, solid-propellant rocket booster and detachable aerodynamic control surfaces for stability. The missile is 16 feet long and weighs 450 pounds. It was developed by Naval Ordnance Test Station, Pasadena and China Lake, Calif., developers of the *Sidewinder* air-to-air missile.

After the destroyer's sonar searching equipment detects and begins the tracking of the enemy submarine, the ships fire-control system trains and elevates the RAT launcher and sets the range. The rocket motor propels the torpedo along a ballistic flight path and separates along with the airframe after burnout. Two parachutes lower the torpedo to the water where the parachutes and nose cap are discarded. The torpedo then starts a circling search pattern until the homing device makes contact and guides the weapon to the target. The missile may also be air-launched. RAT will not home on the launching ship in the event it misses its target.

Military Rockets Cheaper for Space Exploration?

by Norman L. Baker

In recently published secret testimony, Garrison Norton, assistant Navy secretary for air, was quoted as saying that the use of *Jupiter*-C rockets for launching satellites was "very, very expensive and rather inefficient when compared with the Navy's *Vanguard* launching vehicle."

Army officials questioned on this statement answered that this was the reverse of actuality and that Norton's remarks could be easily repudiated.

Norton said it would be wasteful to divert any military missile hardware for space projects "at this stage of the game.

"These motors and complexes were designed for an entirely different purpose: the sending of large warheads certain distances and the placing of those warheads very accurately on target. This is basically an entirely different problem from trying to put a small-size satellite in orbit. I think if you looked into the economics of the business you would find that using any of our large-scale missile hardware to launch satellites is a costly operation compared to *Vanguard*," he said.

Economies of *Vanguard*

A check into the economies of the *Vanguard* and *Jupiter*-C projects and a comparison of the costs of the two brings to light several interesting facts.

The *Vanguard* program, as originally conceived, required 13 launching vehicles to fulfill its mission during the IGY. The first vehicles were modified *Viking* research rockets left over from an earlier high-altitude research program. The third vehicle was a *Vanguard* configuration with a dummy second and third stage. The remaining nine rockets were destined to launch four four-pound test satellites and six 20-pound full-size satellites.

The first appropriation for the *Vanguard* project totaled $29 million. That figure was soon raised to $110 million, the figure released June 1, 1957. It is believed that this total has been increased in recent months but there has been no official release on *Vanguard* funds since the June 1957 report.

The $110-million appropriation figure would give each *Vanguard* vehicle a price tag of approximately $8.5 million. Assuming a 100 per cent success in the satellite launching attempts, the United States would have 136 lbs. of instrumentated satellites circling the earth at a cost of approximately $800,000 per lb. When the *Vanguard*'s empty third stage rocket is included in the satellite weights (it will weigh about 50 lbs. and orbit with the 'sphere') as is done with the *Explorer*, the cost-per-lb.-of-satellite figure drops to about $160,000. Taking into account the last two failures and assuming complete success on the remaining vehicles this latter figure increases to $200,000 for each pound of maximum satellite weight.

Army officials have disclosed that each of the *Jupiter*-C research rockets have an average cost of $1.5 million for hardware and $2.5 to $3 million for accomplishment of a launching. Twelve *Jupiter*-Cs were fabricated for the Army Ballistic Missile Agency's re-entry test program for the *Jupiter* IRBM. Three of these research rockets were tested successfully—out of three launchings. The last one fired propelled a dummy fourth stage rocket and 5-lb. satellite 3300 miles over the Atlantic in September 1956. Officials point out that this shot could easily have launched the world's first satellite.

The three tests convinced the Army that the nose cone re-entry headache was a problem of the past there by making available nine research rockets with satellite capabilities.

Therefore, if the value of the re-entry tests are ignored, the *Explorer* I cost $390,000 for each pound. If the eight remaining *Jupiter*-C rockets each launch satellites of the same weight as *Explorer* I, each pound of satellite will cost $130,000.

Dr. Wernher von Braun announced that a 50 per cent increase could be made in satellite weight and still place the payload in an orbit with the same vehicle. Cost: $65,000 per pound of satellite.

Army officials have stated that a 300-lb. satellite could be launched with the *Jupiter*-C after further modifications. Depending upon how many of these were launched the lb.-satellite figure would range from $12,000 to $65,000.

The total research and development costs for the workhorse of the *Jupiter*-C, the *Redstone* rocket, would obviously raise the costs of the *Jupiter*-C rockets slightly but the costs of developing the individual systems of the *Vanguard* (*Viking*, *Aerobee*, *Hermes* first-stage engine, etc.) must also be considered as above and beyond the *Vanguard* funds.

Based upon the preceding cost figures and anticipated successes versus actual successes *Vanguard* costs would be double to three times those of *Jupiter*-C.

With each launching failure the satellite costs jump sharply and the *Vanguard* still must prove its system capability while *Jupiter*-C continues to pay off.

NAA Hydyne Fuel Boosted *Explorer* I

A Rocketdyne liquid-propellant rocket engine, burning a new high-energy fuel compound and liquid oxygen, provided the first-stage power to lift the Army's *Explorer* I satellite into outer space.

Test-flown more than a year ago, the powerful rocket booster was modified from an engine series in production by North American's aviation division for the Army's *Redstone* medium-range ballistic missile.

The satellite launching fuel was a hydrazine-based compound developed by Rocketdyne engineers. Nicknamed Hydyne, the fuel increased thrust and missile range by 12 per cent over that of a conventional *Redstone* engine.

Dr. Jacob Silverman, supervisor of Rocketdyne's propulsion research thermodynamics unit and a leader in the development of Hydyne, first started work on the new compound early in 1956. The problem faced by Silverman and the company's chemical engineers was that of developing a fuel that would increase performance and could be substituted for the alcohol usually burned in the *Redstone* engine.

Their studies led to two commercially available chemicals that never before had been used at the high-trust levels of rocket engines. By a unique blending of the two, the engineers developed a compound that retained the physical properties of alcohol, required no change in engine hardware or missile tankage, and increased the total burning time and burnout velocity.

The *Redstone* engine series—rated in the 75,000-pound-thrust class—has been in production by Rocketdyne since 1952.

SNARK zero-length launcher which could be used on carrier.

Snark Disclosures Fit with Carrier-base Plan

by Raymond M. Nolan

WASHINGTON, D.C.—Details disclosed by Northrop Aircraft about the *Snark* missile added new credence to the suggestion that *Snark*s be used as an interim intercontinental striking force launched from aircraft carriers (editorial, February m/r).

Northrop Vice President John Alison stated that the *Snark* needed only a minimal launch area because of its zero-launch feature. This raises the speculation that the missiles could be fired from carriers while positioned in the existing launchers now used for ground-based firings. Since the *Snark* uses conventional jet fuel and solid-propellant rocket boosters, the standard Navy objection about liquid rocket fuels would not be raised.

Sources in Washington recently confirmed that the Navy is presently conducting feasibility studies on the carrier-launched *Snark* and that, because of the relatively low cost and short time involved to make this system operational, prospects look good.

A significant statement by Alison was that the *Snark* is not now used to its full operational capabilities but could, in fact, impact on Moscow from anywhere on the eastern seaboard. He gave the range as more than 5500 nautical (6300 statute) miles. Ward Dennis of Northrop's development planning section added that the *Snark* had inherent qualities equal to any manned aircraft and that dogleg courses to avoid populated areas or for maximum evasive action could be programmed into the *Snark* before launch. Dennis also said that a recall signal or the capability for a recall or destruct signal could be programmed into the *Snark* by the launching commander. However, he added, the destruct or recall capability could be sealed off in the case of anticipated enemy interception or jamming on the recall or destruct channels.

When asked about costs of the *Snark*, Dennis stated that the *Snark* is about one-tenth the size of a B-52 and that costs are in the same area—roughly one-tenth that of a B-52. Since present B-52's cost somewhere around $6 million (after production of about 600), a *Snark* probably costs between $800,000 and $1,000,000 now, but could come down in price to $500,000 when a sufficient quantity has been produced.

Mr. Dennis emphasized that, since over $400 million have been pumped into the research and development program, economy of production can never be realized while these units are in pilot production nor can effective retaliatory measures be possible without great numbers of *Snark*s. Present production contracts total $143 million, but the actual number of *Snark*s ordered was not revealed. He proposed that *Snark* be put on a high production schedule for both these reasons.

His contention is that with any

weapon, superiority in numbers is the major factor in the degradation of a defense system and that combinations of high- and low-altitude *Snarks* coupled with IRBMs and manned bombers could achieve penetration far beyond that of one or more IRBMs or ICBMs.

Throughout his talk, Dennis emphasized the terms "large payload" and "thermonuclear payload." This would seem to indicate that the *Snark,* though only one-tenth the size of a B-52, has a warhead capacity near that of a B-52 and certainly well beyond that of an IRBM or ICBM.

AMF Reveals *Talos* Automation System

The first automatic missile loading and launching equipment for firing *Talos* surface-to-air missiles has been completed and is now undergoing extensive testing by the U.S. Army.

Designed and built by American Machine & Foundry under subcontract from RCA, the prototype automatic loading and launching equipment and associated missile handling equipment is installed at White Sands Proving Ground, N.M. Pending the results of current tests and final contract negotiations, pilot production of the launching equipment would take place in a 200,000-square-foot government plant near Rochester, N.Y.

Each *Talos* defense unit includes a missile handling and assembly area and two automatic launchers, each supported by a circular missile-storage magazine resembling a railroad roadhouse. Capable of handling missiles with high-explosive or nuclear warheads, the launchers can fire either single missiles or salvos to engage a number of different targets simultaneously and can continue to fire at a high rate over an extended period of time.

On command from electronic computers in the control station, the launcher turns toward the cell in the circular storage magazine which contains the desired type of missile for the tactical mission. A cart runs out to the automatically preselected cell, picks up a missile and returns to the launcher.

The missile is then positioned in the launcher where it is elevated and rotated to firing position. When the firing signal is received, the missile is fired automatically and the launcher recycles for the next round.

If it is desirable to unload the launcher, this operation is accomplished automatically making possible the rejection of a missile at any time. Execution of the launching cycle requires no operation personnel whatsoever.

HACKNEY shapes save for missile producers, too!

The Hackney Method of producing components by deep drawing cold steel, widely used in many industries, produces missile parts economically.

Hackney produced components give engineers more latitude for solving design problems. Savings can be made in over-all weight, assembly time, and through elimination of nonessential parts.

Hackney deep drawn seamless parts provide maximum strength with minimum weight, resist both internal and external pressures.

Consult with Pressed Steel Tank Engineers

The Hackney Method may be the answer to some of your stubborn production problems. Let us know what you want to do. A simple sketch will be helpful. Since we work in steel, stainless steel, nickel, aluminum, magnesium, copper and alloys, add a note about the metals you have in mind. Our engineers will have some practical ideas to send you. '55 Decision Blocked Army Satellite Try

In the wake of the failure of the Navy's *Vanguard*, Feb. 4, a check of information available in Washington has made it apparent that a little-known committee action in 1955 may have been a root of the trouble. The difference might have been an American satellite in orbit two years ahead of *Sputnik* I—if Army vehicle proponents were right in their claims—but certainly a year earlier.

The decision—by Deputy Defense Secretary Donald Quarles—was announced July 29, 1955, when the U.S. Government ruled out the Army-backed Project *Orbiter* in favor of *Vanguard*. Action was based on a six-to-three vote of the so-called Stewart Committee, which had been given the job of deciding which vehicle the United States would back in its IGY satellite-launching program.

The committee consisted of Dr. Homer J. Stewart, chairman; Dr. Clifford Furnas, Dr. Robert McMath, Dr. Joseph Kaplan, G. H. Clement, Prof. John B. Rossner, Dr. Charles Lauritsen, RADM Paul A. Smith (USCG Ret.), and Dr. Richard Porter—who is now chairman of the U.S. International Geophysical Year Satellite Committee.

No reason for the committee majority's disapproval of the *Orbiter* proposal has ever been given officially, but the three dissenters, Drs. Stewart, Furnas and McMath, wrote a strong dissent.

A comparison of the 1955 proposals shows that *Orbiter* consisted of a *Redstone* first stage with clusters of *Loki* rockets in the succeeding stages; while *Vanguard* was to have some sort of *Viking* configuration with a *Hermes* engine to power it (in the first stage).

In theory, this was fine. General Electric, at the time, had several *Hermes* engines on the shelf and the idea of the *Vanguard* people was that these could be fitted to vehicles in a hurry—thus first-stage power would be no problem. But, according to one Pentagon source, the *Hermes* engines proved to be, among other things, too rusted for use on the first-stage vehicle. GE had to design a new first-stage engine, although *Orbiter* backers insist that Reaction Motors already had an engine which could have put the *Vanguard* first stage in the air.

Nevertheless, GE tackled the job of coming up with an entirely new engine and it is this unit which currently powers the *Vanguard* in the first part of its journey. Meanwhile, ABMA was shooting *Redstones* almost at will, with few failures.

Only under the impetus of the Russian achievements was the Army proposal reactivated—this time under the name of *Jupiter*-C, the designation of the vehicle which had solved the nose-cone re-entry problem for the Army.

The rest is history—America had a satellite put into orbit by a vehicle

Presidential Science Adviser Dr. James R. Killian, Jr., chats with Diversey Engineering Co. President J. H. Kauffmann, at the conference on "America's Human Resources to Meet the Scientific Challenge" Feb. 3-4 at Yale University. A joint project of the President's Committee on Scientists and Engineers and the William Benton Foundation, the conference's object was to explore methods for improving the U.S. supply of scientists and engineers. Those who participated included leading industrialists, educators, scientists, private study groups, interested government officials and members of the national press.

D-C Amplifier

Isolated input, unmatched stability, and high common-mode rejection.

The Neff 1-100C successfully combines both a floating input and a truly stable output . . ideal for amplification of low-level signals from thermocouples, strain-gage bridges, and bridge transducers. Input and output are isolated from each other and from ground, thus preventing circuit ground loops and paralleling active arms of bridge transducers.

Specifications

Input:	±5 mv or ±10 mv.
Output:	0.5 v into 100 ohm load 1 v into 200 ohm load
Linearity:	0.05% full scale
Input R:	500 k
Gain:	Variable 0 to 100
Stability:	0.2% full scale
Drift:	Less than 5 μv
Noise:	Less than 5 μv
Isolation:	D-C, 160 db A-C, 114 db at 60 cps.

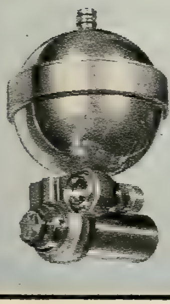
TYPICAL APPLICATIONS OF SPERRY SOLID-PROPELLANT MISSILE COMPONENTS



Gas generator pressurizes hydraulic accumulator—can also drive turbines, operate pneumatic servos, provide jet thrust, give instant power for any requirement.

Solid-fuel powered components for missile guidance and control

Sperry opens new laboratory for advanced design and development

From standstill to 50,000 rpm in one-fifth second—that's the performance recorded by a Sperry solid propellant-driven gyroscope recently developed for missile applications. It explains why solid-fuel propellants have caught the eye of missile designers looking for lightweight auxiliary power sources.

It's also the reason Sperry has built and staffed a completely equipped laboratory on Long Island expressly to design, develop and evaluate solid-propellant devices. Here work is in progress on propellant-driven rate-measuring, directional and roll reference gyros, hot-gas servos, gas generators, arming devices, gas-pressurized hydraulic accumulators, mechanical actuators and jet thrust steering units.

Easy to handle and control, solid propellants can be stored indefinitely with no loss in ability to provide tremendous energy instantly. Fewer working parts are required in devices employing solid fuel for power, which means their reliability is greater while their cost is lower.

Sperry is ready to undertake design, development and production of these high-precision propellant devices. For more information, write our Air Armament Division.

A Message to Executives Seeking a New Plant Site

Before You Decide . . .
Check These Three Plant Location Advantages

IN PENNSYLVANIA

100% FINANCING FOR YOUR NEW PLANT

Complete financing for Lease-Purchase of a new plant is available in labor-surplus areas of Pennsylvania. Interest as low as 2%, with deferred amortization, can be applied on up to one-half of total plant cost.

100% financing is also available in other areas of the state through special arrangement with community organizations and financial institutions.

You select your community. You specify plant construction details or choose one of several plant "shells" now being readied for completion.

IMPROVED "TAX CLIMATE"

Pennsylvania recently took major steps to create a new "tax climate" favorable to new and established industries. The following basic tax changes were enacted in 1957:

Manufacturers were exempted from capital stock and franchise taxes;

Machinery and equipment taxes were eliminated, state-wide;

Stock transfer tax was repealed;

Temporary 3% sales tax was made permanent;

Sales tax on purchases by manufacturing firms was reduced.

The absence of a state personal income tax, plus these new tax revisions, provide a major tax advantage to companies located in Pennsylvania.

PLANT LOCATION SERVICES

The Pennsylvania Department of Commerce, through its staff of engineers and economists, will "custom-tailor" complete plans for a new plant site to your specific requirements. Special reports and tabulations will be presented covering labor, markets, transportation, communities, raw materials, minerals, water, power, fuel, engineering services, research laboratory facilities, etc.

Industrial representatives are also available to you for personal inspection tours and consultations concerning your plant location needs. *All inquiries are confidential!*

not much different than the one proposed while Project *Orbiter* was still alive.

As for the *Vanguard*, in spite of official reasons released to the public, the general opinion is that it has not flown mainly because of an inadequate first-stage engine.

Sources close to the situation say that failure of the *Vanguard* that attained a 96-inch altitude before burnup was due to engine-wall failure. Unburned fuel used for regenerative cooling prior to ignition caught on fire when the engine wall gave out under excessive temperatures.

The second failure—the one caused by midair breakage—was blamed on a faulty wire in the control system. It is believed that this wire broke because of excessive vibration. Statements in the general press, such as "the *Vanguard* finally struggled into the sky" are the clue: the marginal thrust-to-weight first-stage engine got the *Vanguard* off the ground but components normally able to withstand missile flight could not put up with the vibrations encountered as the missile groaned skyward.

Lockheed Prepares *Polaris* for Ground Test

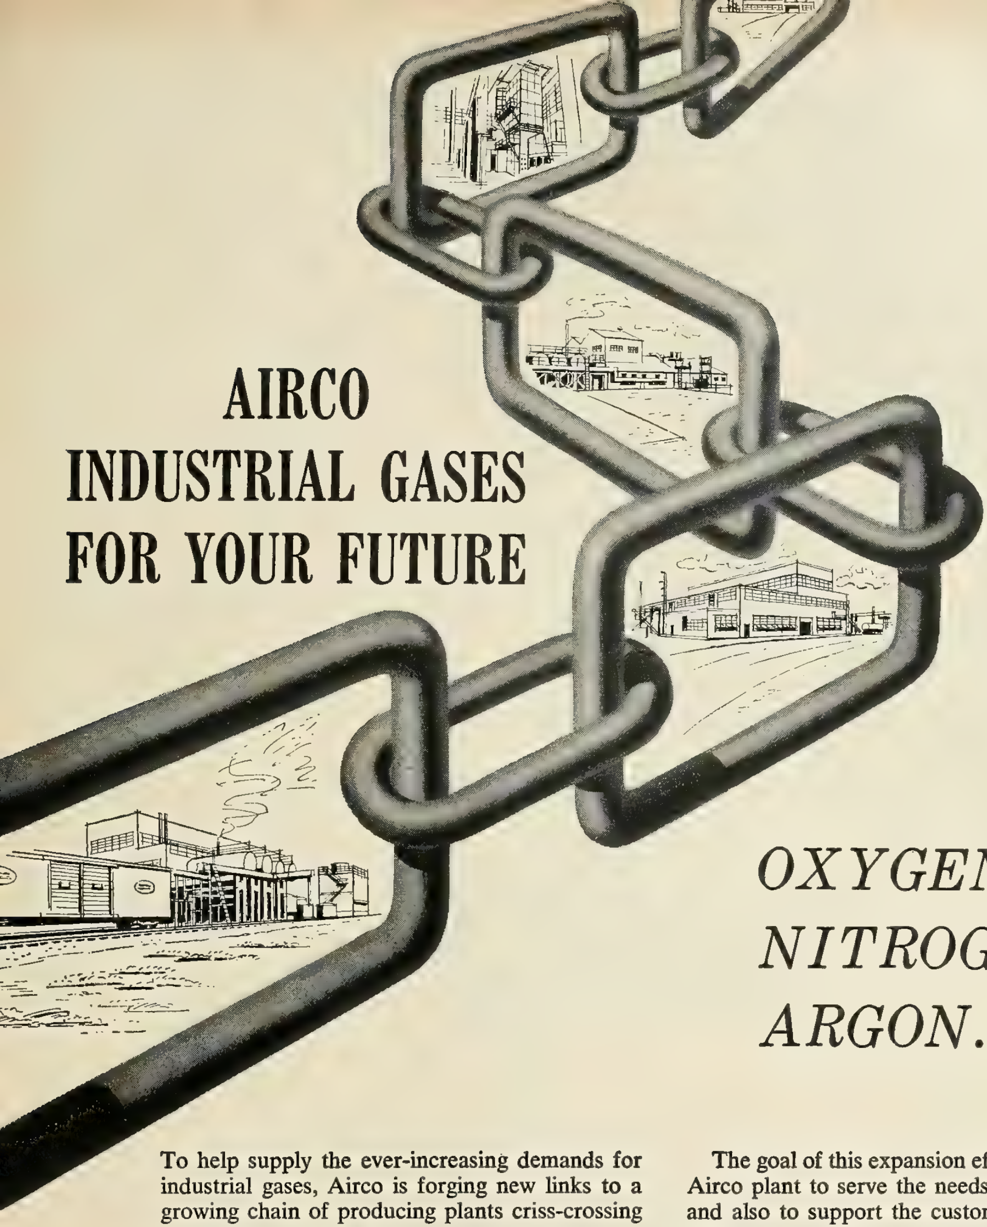
The Navy is accelerating the ground test program for the recently accelerated *Polaris* fleet ballistic missile. First ground test is expected within the next few months. This program is in addition to the *Polaris* test vehicle program which has been underway since last fall.

Construction will begin immediately on a special Navy-owned *Polaris* test facility on 271 acres loaned to the Navy by Lockheed. This multimillion-dollar building project, comprising a complex of huge concrete and steel missile test stands and special related buildings will be located at Lockheed's 4000-acre remote test site in the Santa Cruz mountains south of San Francisco.

L. Eugene Root, general manager of the Lockheed missile organization, said that the recently announced acceleration of the submarine-launched *Polaris'* development places heavy importance on the new ground test station.

"Because we must compress *Polaris* development time, we must speed up our program with as much ground testing as possible of each component or whole missile before we finally expend it in flight test," he said.

Root explained that static or ground testing of parts at the new facility will take place under conditions that



AIRCO INDUSTRIAL GASES FOR YOUR FUTURE

OXYGEN...
NITROGEN...
ARGON...

To help supply the ever-increasing demands for industrial gases, Airco is forging new links to a growing chain of producing plants criss-crossing the country. Some of these new facilities are already in operation, others will be in operation by the latter part of this year. This multimillion dollar construction program will greatly increase our capacity to supply your present and future requirements for oxygen, nitrogen, argon and other gases.

The goal of this expansion effort is to gear each Airco plant to serve the needs of its own area—and also to support the customers of any Airco plant in an adjacent territory by providing deliveries of the industrial gases needed in the quantities required.

The services Airco offers its customers are well worth your consideration. Let your nearest Airco office help plan the most economical gas supply for your needs and the most efficient way to use it.

are closer to actual flight conditions than any other method short of flight. Actual firing of rocket engines, for example, will create flight-like conditions of heat and vibration during the checkout of electronic equipment, guidance systems and other key components.

Goal of the tests will be to increase system reliability, decrease overall test-program costs and speed availability of the operational *Polaris* missile, Root added.

Supporting the Santa Cruz test-stand complex, the Navy *Polaris* test facility will have a control blockhouse with elaborate instrumentation, control and simulation equipment; an assembly building, engineering building and test-stand workshop.

Franklin Institute to Run Astronautics Lecture Series

A series of 10 space travel lectures, "Ten Steps Into Space," will be given at The Franklin Institute, Philadelphia, Pa., on Tuesday evenings at 8 p.m. from March 4 through May 6.

Dr. I. M. Levitt, Director of The Franklin Institute's Astronomy division, announced the lecturers will be the ranking men in the astronautics field in this country. Each authority will speak on his specialty.

Willy Ley, noted historian on space travel, will begin the series on March 4. Dr. Ley's lecture, "The Long History of Space Travel," will provide the foundation for the following talks.

Other lectures are: March 11—Kurt Stehling, "The Rocket and the Reaction Principle;" March 18—S. Fred Singer, "Satellite Instrumentation —Results for the IGY;" March 25—Krafft A. Ehricke, "Space Navigation —The Path to the Planets;" April 8—Ernst Stuhlinger, "Propulsion Systems —Gases, Ions and Photons;" May 6—I. M. Levitt, "Satellites and Travel in the Future."

The series fee will be $10; individual lecture fee, $1.50. Persons may register by mailing the fee to: Astronautics, The Franklin Institute, Phila. 3, Pa.

Univ. of Mich. Offers Automatic Control Course

The University of Michigan College of Engineering has announced a summer Intensive Course in Automatic Control scheduled for June 16-25, 1958, inclusive. The course is intended for engineers who wish to obtain a basic understanding of the field, but who cannot spare more than a few days for this purpose. Its aim is to make the subject matter easy to learn

critical laboratory accuracy guaranteed under most severe conditions

CEC's 4-120

vibration pickup

The first vibration pickup to combine critical laboratory accuracy with ruggedness for operational use, CEC's new Type 4-120 is ideal for turbojet, turboprop, and machinery vibration studies. It is designed to be mounted omni-directionally and remain essentially insensitive to transverse vibrations, accelerations, or shock. Two control magnets make possible individual adjustment of sensitivity and optimum damping at the selected temperature. Extremely rugged, the 4-120 has a frequency range from 40 to 2000 cps, and an operating temperature range of −65°F to +500°F. Pickup weighs only 5.15 oz. complete with connector plus 3½ ft. of cable, is hermetically sealed against moisture and corrosive atmospheres. Contact your nearest CEC sales and service office, or write for Bulletin CEC 1575-X4.

Ford Instrument Co. Engineer checks air-bearing gyro for angular drift on equatorial test stand. Test can show up drift rates as low as one revolution in 40 years. Tests like this . . .

helped Army put "Explorer" into orbit

Some of Ford Instrument's current or recent programs include:

Inertial guidance systems . . . including Redstone and Jupiter
Missile launching and control order computers
Navigational and mission control systems and computers
Analog and digital computer systems
Fuzing, arming and other warhead control equipment
Plotting equipment
Nuclear systems and controls
Gunfire controls
Drone controls

A special guidance system for the Jupiter C, developed by the Army Ballistic Missile Agency, was used to launch the first U. S. artificial satellite into space.

Many components of this system were provided by Ford Instrument Co., prime contractor for both the "standard" U. S. Army Redstone and Jupiter guidance systems.

The fabulously-equipped, fantastically-clean gyro lab (above) is only a small part of the advanced research and development facilities available at Ford Instrument Co. They're used to create and produce the incredibly accurate control systems called for by modern technology in both government and industry.

And Ford Instrument's large-scale precision manufacturing facilities can turn even the most critical system requirements into working "hardware" on a quantity-production basis. Our Liaison Engineers are at your service to discuss your system requirements.

by a coherent presentation in class of the fundamentals of modern automatic control, and by providing a comprehensive set of notes which will serve as a framework for further study.

The course is built around the principles and application of measurement, communication and control. The material will begin with the fundamentals in each of these fields and will include some basic work in nonlinear systems. This will be followed by applications of the fundamentals to more advanced problems.

There will be four hours of lecture each morning and three hours of laboratory demonstration in the afternoon. Extensive use will be made of computing, instrumentation and servo laboratories on the campus. The role of analog computing methods will be emphasized. This course has been given summers since 1953.

April 15 is the closing date for registration. Further information may be obtained by writing to Prof. L. L. Rauch, Room 1525 B, East Engineering Building, University of Michigan, Ann Arbor, Mich.

Research Group Sponsors German Ballistics Session

The AGARD Wind Tunnel and Model Testing Panel will sponsor a ballistics meeting in Freiburg, Breisgau, Germany, from April 22 to 25. Subjects will include the historical development of ballistics, high-velocity guns, range techniques and long-range missiles. Some 15 papers will be presented.

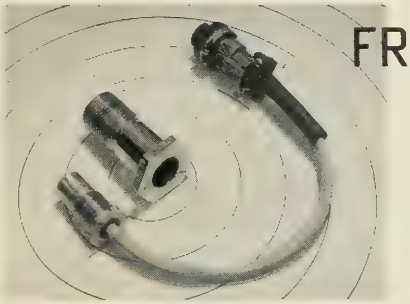
Scientific Progress Vital to Survival—Dr. Ramo

"Scientific developments in electronic computers and other synthetic intelligence devices may be more important in our race for survival than space supremacy," Dr. Simon Ramo, chief scientist for the Air Force ballistic missile program, said recently.

"Space conquest, intercontinental ballistic missiles—neither of these new technological advances would be possible without a multitude of instruments that extend man's senses; that observe and remember, compute faster and more efficiently than the human brain under similar circumstances," he added.

Speaking before the American Institute of Electrical Engineers in a special session devoted to "thinking machines" of the future, the president of Space Technology Laboratories said, "Total brain power of a nation in the coming half century is going to be the determining factor in that nation's

do you have these missile power problems?

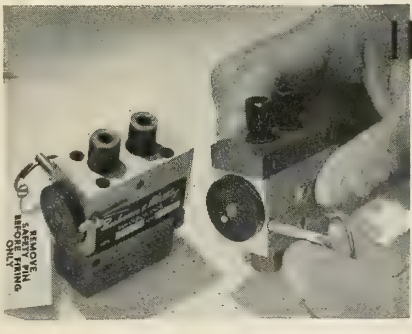


FRACTURING?

Frangible bolts from the Beckman & Whitley line combine the optimum in dependability and convenience for separating structures by electrical signal. Made to specifications, these bolts are internally threaded to receive the pre-wired charge which then attaches by standard connector to the missile circuitry provided. We'd like to help with *your* needs.

DISCONNECTING?

Double certainty of positive electrical disconnecting is provided by the selectively fired, two-charge design of this example from the line of Beckman & Whitley electrical disconnects. Shown assembled at right, this device can be provided with alternative primers as shown in the center. Shear pins hold the unaltered electrical connector assembly rigidly together until either or both primers are fired. Ideal for umbilical connections or other applications where guillotine choppers are not applicable. Perhaps these would help on *your* project.



INITIATION?

Same basic mechanism serves, right, as a detonator-safe primacord initiator, having a lanyard-operated safety pin; or, by the substitution of an explosive charge, bottom left, unit becomes a destructor. Two separate channels for top reliability, mechanism so designed that reinsertion of safety pin reverses unit from "arm" to "safe" position. If these sound too simple, we can show you some *complicated* ones.

Pre-packaged explosive power units provide higher reliability and greater power for a given weight and volume of space than any other actuation method. Some of the many other applications to valving, ejecting, fracturing, etc. may be interesting to you. Just ask us.

progress. However, that ability is not set just by the number of human brains in each nation, but rather how those brains are used and how they are assisted by synthetic intelligence devices.

"In every phase of our economy—engineering design, factory operations, communications, transportation, and in the military—we are making tremendous strides in the extension of human brains and senses," he said.

"For instance, I think we are ahead of the Russians today in the techniques that extend and make more useful each brain, each pair of eyes in our nation." Space Technology Laboratories is a division of The Ramo-Wooldridge Corp., and has as its primary job engineering direction of the overall missile systems, *Atlas, Titan,* and *Thor,* the Air Force's long-range ballistic missiles.

Automatic Test Equipment to be Made Under License

Automatic equipment for production testing of complex fire-control, flight-control and missile systems, developed by Westinghouse, will now be manufactured under license by Mason, Shaver and Rhoades Sales, East McKeesport, Pa.

The four basic automatic units involved in the licensing agreement are: a dc resistance tester, developed for high-volume testing of components such as transformers, which automatically bridge-tests items through a range of 0.001 to 10,000 ohms; a precision potentiometer tester which tests ganged computer-type potentiometers for resistance, terminal linearity, dielectric strength and electrical noise; a turns-ratio tester which tests the electrical relationship between the number of turns in transformers of multiple windings at a test rate of 15 seconds per transformer, and a flux-reset-type core tester for testing all types of magnetic amplifier toroidal cores.

Epsco System Used by General Electric

Makeup of the analog-to-digital subsystem in the GE missile and ordnance systems department's data-processing center has been described by its manufacturer, Epsco Inc., as a major advance in automatic data reduction. The subsystem forms part of the integrated computing facility described in the February issue of m/r.

However, Epsco points out, even though this conversion subsystem was designed, built and delivered in less than 10 months through extensive use of modular techniques, new advances are already in the design stage.

The new technique uses Universal System Logic Boards—solid-state printed wiring circuits which may be combined without modification to comprise complete system logic for data-handling applications, from process control to telemetry data reduction. The use of such pre-engineered modules is, Epsco feels, the answer to improving electronic system reliability even in the face of increasing system complexity.

'Most Accurate' Radars Track *Explorer* Launching

When the Army's *Explorer* rose into its history-making orbit, its flight was followed by two of the most accurate tracking radars in the world, it was disclosed today by the Radio Corporation of America.

A number of these instruments, RCA vice president, A. L. Malcarney said, are currently being produced in

CONTRA-ROTATING WEIGHTS ELIMINATE CROSS TALK IN HUMPHREY ACCELEROMETERS

When an accelerometer used to measure motion of a body in one direction is influenced by motion in another direction, the resulting "cross talk" leads to inaccuracies. Humphrey licks this problem by building accelerometers that cancel out cross talk.

The diagram illustrates the principle. There are two contra-rotating weights on arms that are flexure mounted so they are free to move. Where the arms cross, they are pinned together with a slot and pin that allows them to move. Assume the accelerometer is measuring vertical motion as shown by the arrows. Lateral motion can't produce error in vertical measurement because "up" error of one weight is cancelled out by "down" error of the other. Flexibility of this design permits covering a wide range of operating characteristics. Low natural frequencies can be furnished to filter out mechanical vibrations. Let us work with you on your linear or angular accelerometer requirements. Write today.

quantity for installation on Army, Navy and Air Force missile ranges throughout the country. They are the first specifically designed for guided-missile range instrumentation, and are the result of a ten-year program of research and development carried out by RCA in conjunction with the applied physics laboratory of Johns Hopkins University, the Navy Bureau of Ordnance and the Navy Bureau of Aeronautics.

"The radars, located on the Florida coast and on Grand Bahama Island, 165 miles away, provided information vitally necessary for the successful orbiting of the satellite," Mr. Malcarney said.

"The AN/FPS-16 is also used for tracking in the Army's *Talos* defense unit missile system, and is adaptable to most of the U.S. missile systems."

According to Malcarney, the radar development "was accelerated by the large-scale testing of guided missiles and the resultant need for providing fast, accurate, tracking data. The AN/FPS-16 tracks in total darkness, through clouds and at long range. Tracking data is almost immediately reduced to their final form. Previously, weeks were required to translate tracking data to intelligible form."

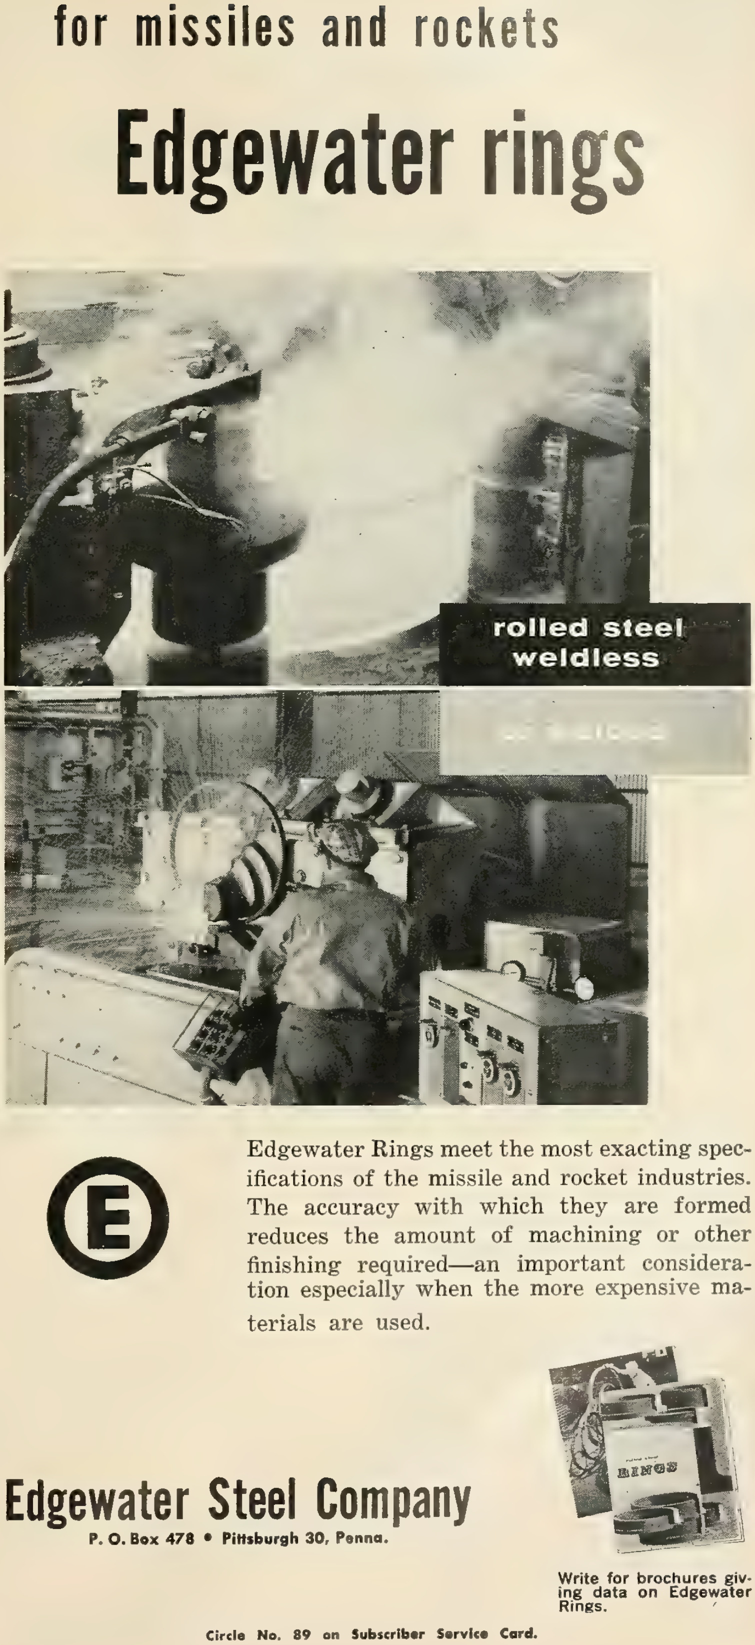
"Still another feature of this highly accurate radar" Malcarney said, "is its ease of control with only a single operator needed for each unit. It is also reliable, functional under all weather conditions, flexible and highly standardized for use by all three services, thus eliminating duplication of effort.

"Along with the more glamorous missiles that soar majestically into the sky every day, this precision radar is playing a tremendously important supporting role in the drama of national defense."

Market Guide, Directory Publication Set in April

The first annual edition of the Missile Market Guide & Directory will be published by American Aviation Publications, Inc., publishers of Missiles & Rockets, in mid-April 1958. This book, the only complete marketing directory of the missile industry, has been over a year in preparation and will cover all phases of this rapidly growing industry.

Included in the Missile Market Guide & Directory will be a marketing section outlining the procurement policies of the Department of Defense and the various services; an alphabetical listing by company of over 2500 prime contractors, subcontractors and equipment manufacturers showing plant



for missiles and rockets

Edgewater rings

rolled steel
weldless

Edgewater Rings meet the most exacting specifications of the missile and rocket industries. The accuracy with which they are formed reduces the amount of machining or other finishing required—an important consideration especially when the more expensive materials are used.

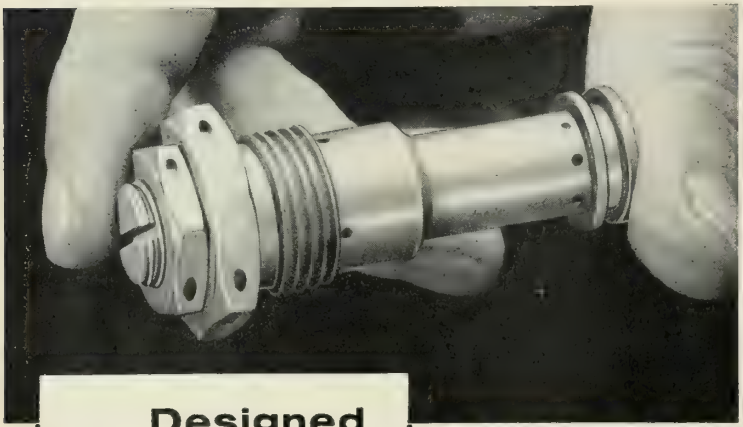
Fluid Regulators

High Pressure
Pilot Operated
Relief Valves



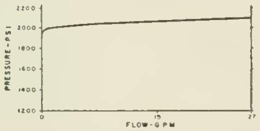
. . . Designed and Built To Meet Your Requirements

■ This typical Pilot Operated Relief Valve is just one of many hydraulic and fuel valves designed and built by FLUID REGULATORS for major aircraft accessory manufacturers. This particular valve controls the output pressure of a gear pump which is the source of power for flight control of a production missile.

Like all Fluid Regulator's valves, it meets the critical requirements of weight, size and dependability demanded by all missile applications.

Specialized knowledge of fluid power problems plus broad experience in meeting aircraft industry requirements, fully qualifies FLUID REGULATORS to design and produce control devices to meet your most exacting needs.

Typical Pressure-Flow Curve For Above Valve



TYPICAL SPECIFICATIONS:

- **Application:** Pilot Operated Relief Valve For Missile Flight Control.
- **Media:** MIL-O-5606
- **Pressure Range:** Adjustable to 4000 psi.
- **Capacity:** To 27 GPM.
- **Temperature:** —65°F to +250°F.
- **Construction:** Threads to mate ⅞ - 14 UNF. Working parts hardened stainless steel.

location, purchasing & sales personnel, and products; and a completely cross-indexed missile catalog of over 4500 items that go into a missile and the companies that manufacture them.

Questionnaires have been sent to some 10,000 companies in the missile industry and the editors have advised that companies who have replied by March 8 can be included in the directory.

Copies of the MISSILE MARKET GUIDE & DIRECTORY will be distributed to all subscribers of MISSILES & ROCKETS as part of their subscription. Additional copies, at $5.00 each, can be reserved by writing to the Circulation Director, MISSILE MARKET GUIDE & DIRECTORY, American Aviation Publications, Inc., 1001 Vermont Ave., N.W., Washington, D.C.

Rocketdyne Awarded Nuclear Rocket Contract

Rocketdyne, under an Air Force contract, is conducting studies and research activities directed toward a nuclear rocket engine. The contract is administered by Wright Air Development Center and is in coordination with previously announced work of the Atomic Energy Commission.

The present contract extends pioneering work by North American in the nuclear rocket field. The nation's first studies and experimental research were carried out by the company as early as 1946.

Rocketdyne project engineer for the nuclear rocket studies and research activities is Dr. S. V. Gunn, a graduate of Purdue University who joined the North American division in 1953.

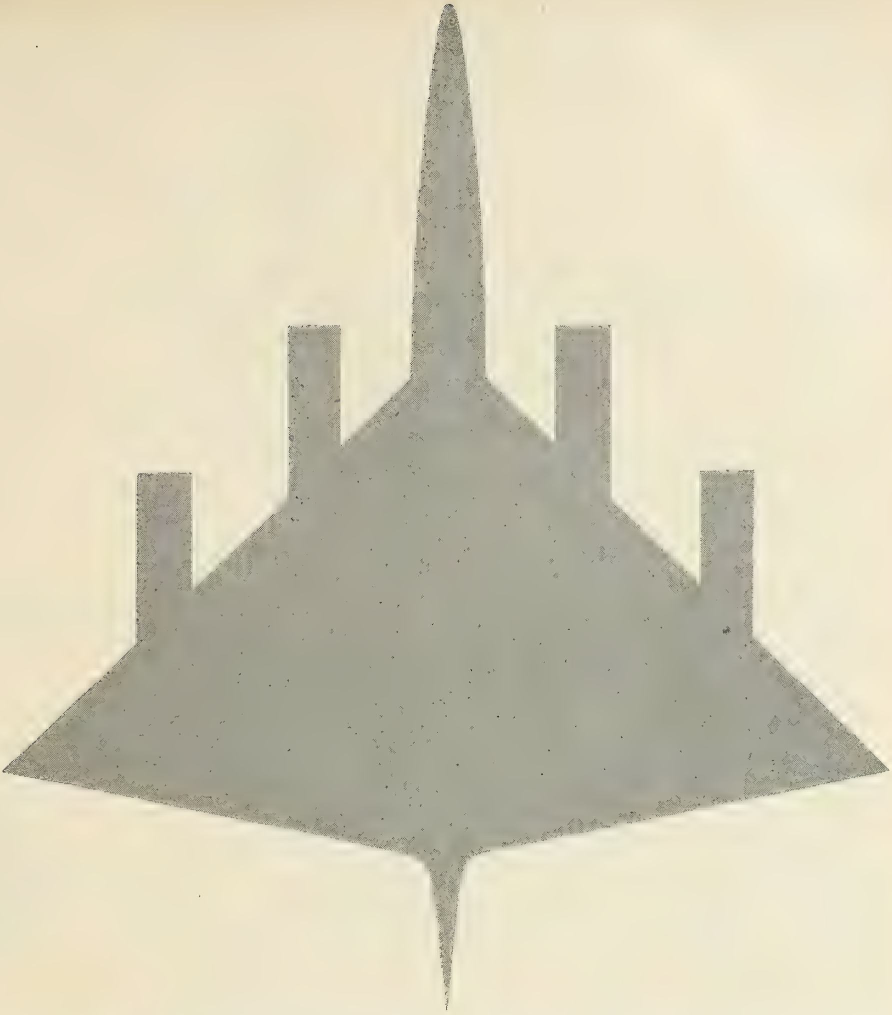
AF High-altitude Chamber Due for Midyear Operation

ALAMAGORDO, N. Mex.—Finishing touches are being placed on a new high-altitude chamber here at the Air Force Missile Development Center.

This test and research facility—two years abuilding—is expected to go operational around midyear. Under the high-altitude division of the Directorate of Ballistic Missile Test, the new facility is slated to further extend the frontiers of men and missiles into space. Altitudes of 140,000 feet can be simulated but the capacity can be pushed to 250,000 feet.

Function of the chamber is to check out large components of vertically launched rockets, high-altitude balloon chambers, and other packages, under simulated and reproducible conditions for periods of as long as 60 days.

Unique feature of the chamber



FOR FAST SERVICE...IMMEDIATE DELIVERY ON AIRCRAFT ALUMINUM EXTRUSIONS...CALL *General Materials*

When you need aircraft aluminum in rod or bar stock, AND shapes, extrusions or tubing, you can fill all your requirements from General's complete stocks of Bridgeport Aluminum Aircraft Shapes—available from our East Coast Warehouse in New York or our Dallas, Texas, warehouse.

We carry a complete line of aircraft sections...angles...channels...tees...zees...I beams...hollow sections...structural and AND shapes—all for immediate delivery.

Call, write or wire collect for fast service. And for a detailed catalog outlining General's aluminum products, write on your letterhead today.

STOCKS

a FRETTING-CORROSION problem had him in a spin

Finding a wear-resistant coating for turbine engine shaft seals posed a serious problem for an aircraft engine manufacturer. Even the hardest alloys were subject to fretting corrosion and had to be replaced after a few hours of service.

This fretting-corrosion problem was solved by having the bearing surface of the seal Flame-Plated by LINDE. By this special detonation process, particles of tungsten carbide are literally *blasted* onto almost any metal surface. Most important, the temperature of the part being plated never exceeds 400° F., so there is little chance that the base metal will warp or that its metallurgical properties will be changed. Flame-Plated tungsten carbide coatings can be applied in thicknesses from .010 to .002 inches. Coatings can be used in the as-coated condition (125 microinches rms) or ground and lapped to a 0.5 microinch finish.

If your design involves metal parts subject to extreme wear, heat, or fretting corrosion, perhaps Flame-Plating can eliminate some or all of your "headaches"—or make possible some completely new idea.

To find out, write us about your wear problem or request a free copy of LINDE's booklet, "Flame-Plating," F8065. Address Flame-Plating Department.

is the automatic programming capability of simulating pressure, temperature, humidity and solar radiation environmental characteristics encountered in flight of rocket missiles and high-altitude balloons. With an eye to space biology, infrared radiation production and control has received special attention.

Inside-chamber work space is 8 feet wide by 8 feet high by 11 feet deep. Main access door—monorail hung—is 8 feet by 8 feet and opens one entire side of the chamber. Chamber lighting, designed for near-vacuum conditions, gives an intensity of 30 foot candles. The floor can take loads of up to 450 psf while 1,200 pounds can be hung from the ceiling. An anteroom provides an air-lock method of entering or leaving the main chamber without test cycle abortion.

Various utility penetrations are provided—including three window ports. Four oxygen outlets are located in the chamber itself with another outlet in the anteroom. An intercom and electrical patch system are also provided.

Instrumentation includes recorders for dry bulb temperatures, wet bulb temperature, dew point temperature, and two altitude recorders. All of the instruments are made up of two prime components: a programmer strip-chart instrument, and a recording strip-chart. The programmers are the curve-following type, utilizing a photronic cell and light-beam principle.

Curves are plotted on a strip chart to program any cycle or series of cycles within the capacity and ranges of the chamber machinery. Automatic digitized logging equipment is associated with the chamber instruments and will type out a readout and punch IBM type.

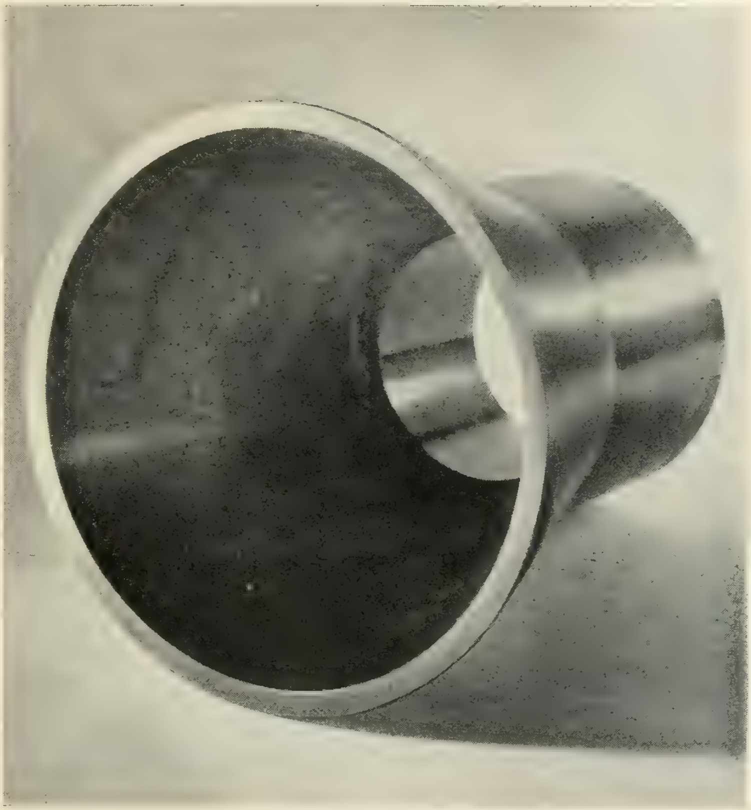
Housing for the chamber is a concrete masonry structure. The main test-chamber space is 44 feet by 40 feet with 16 feet (clear) of ceiling. Evacuation system consists of three 900 cfm pumps. Refrigeration system (cold wall) uses Freon-22. High stage is 40 hp while the two lower stages are 25 hp each. Heating space is electrical. The normal complement of persons regularly assigned to operate the facility are an Air Force officer, a civilian mechanical engineer, an instrumentation specialist, a refrigeration mechanic, four operators and a secretary.

Performance capability of the chamber is:

TEMPERATURE. –100°F to 200°F. With a one-ton workload, the air temperature can be lowered from 80°F to –100°F in four hours at ambient altitude pressure or raised to 200°F in 20 minutes. Cold wall temperatures of –100°F can be obtained

Do you have a hot throat problem?

Solution: R/M PYROTEX REINFORCED PLASTICS



When missile temperatures rise as high as 10,000°F, and you have to meet structural as well as thermal insulation requirements, your problem is a big one. You have an excellent solution: R/M Pyrotex—a complete line of asbestos-base reinforced plastic materials.

The rocket exhaust throat shown here is an example of what these important new R/M materials can do for you. They provide exceptionally high strength-to-weight ratios, take a smooth finish, and can be mass produced to precision standards. Other missile parts for which R/M Pyrotex has been selected: nose and exhaust cones, blast tubes, grain seats, fins and combustion chamber liners. If heat extremes are part of your problem, it will pay you to get more details on R/M Pyrotex!

in one hour at altitudes of up to 140,000 feet. Some 8 kw of electrical energy can be dissipated at –100°F. Dry bulb temperature accuracy is to ±0.75°F.

HUMIDITY. Relative humidity can be increased from 5%-100% at 33°F to 200°F. Humidity can be increased or decreased 5%-95% at 200°F in two hours. Overall humidity accuracy is ±3% RH.

ALTITUDE. Range is from location (4100 feet) to 140,000 feet. With ideal conditions it may be possible to obtain 250,000 feet. Rate of ascent is 4100 to 140,000 feet in three minutes and 23 seconds. Maximum descent is 50,000 fpm with the controller or emergency descent from 140,000 feet to ambient in 30 seconds. Altitude accuracy is ±1% from 0 to 100,000 feet or ±2% from 100,000 feet to 140,000 feet.

The chamber is available for use by any Defense Department agency or private industry engaged in defense contracts. Normal users will be Air Force groups engaged in upper-atmosphere research and Air Force guided missile contractors.

Reliability Films Sponsored by U.S. Navy

The Bureau of Ordnance, U.S. Navy (ReS1) is currently soliciting suggestions to illustrate given points or principles in a series of sponsored films on the aspects of reliability. The series will consist of nine films and work has already begun on the first two. The films will be unclassified and will be available for use by universities as well as industry and the military. The Navy hopes that scholastic use will be a means of reaching the graduates who enter the government and industry each year, providing them with some advance consciousness and awareness of the importance of reliability.

Basic concept of this series is that, to achieve high reliability, it is necessary to start with the people who constitute the maker-user team and to inform and educate in a manner that will develop mental attitudes and approaches focused toward high reliability.

Titles for the films planned range from: "Why So Much Concern," "Basic Steps and Procedures in Planning," "Design Approaches," on through to the final title, "The Maintenance Factor."

Mr. P. R. Wheeler, BuOrd, states that suggestions will be welcome so that the films will have maximum appeal and effectiveness. All correspondence should be addressed to the Bureau of Ordnance, ReS1, Department of the Navy, Washington 25, D.C.

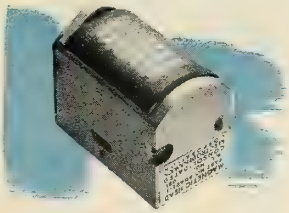
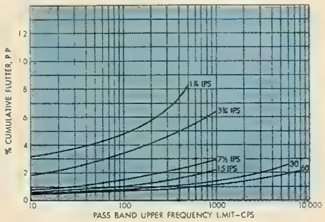
only **DataTape** *offers*

all-metal-surface magnetic heads

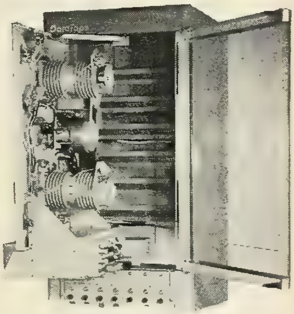


No more drop-outs or loss of high-frequency response because of oxide build-up on heads. All-metal-surface... rather than conventional metal-plastic combinations... promotes a self-cleaning action and minimizes head wear.

lower flutter even at low tape speeds

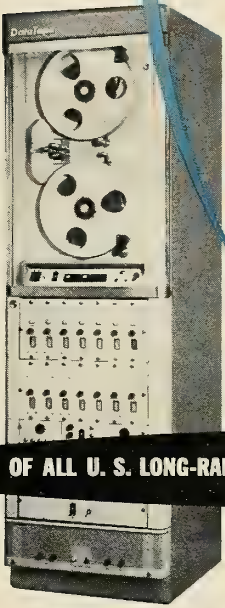


Cumulative flutter at 1⅞ and 3¾ ips is approximately one-half that found in other tape equipment. CEC is first to achieve the low-speed flutter characteristics shown at left. Chart shows flutter recorded at 30 ips and played back at speeds indicated.



complete front access

The 5-752 is the only recorder/reproducer offering complete front access to all incoming and outgoing signal, control, and power interconnections. Access to internal amplifier circuits is through standard connectors on front of unit. All electronics are mounted on drawer slides.



CEC *magnetic tape recorder/reproducer system*

90% OF ALL U. S. LONG-RANGE MISSILE TEST FLIGHTS ARE RECORDED ON CEC DATATAPE

Simplify your data problems. Get instantaneous playback up to 14 tape tracks with CEC's 5-752 Recorder/Reproducer System with simultaneous recording or reproducing of separate signals on one-inch tape. Seven different types of plug-in amplifiers record and reproduce in Analog, PDM, or FM modes. Contact your nearby CEC field office, or write for Bulletin CEC 1576-X15.

TYPICAL APPLICATIONS — Telemetering from Missiles and Aircraft, including FM sub-carrier telemetering. Wind-Tunnel Testing. Jet and Rocket Engine Testing. Studies of Shock and Vibration. Mobile and stationary Structural Testing: ships, trains, etc. Static and Dynamic Testing: airframes and components. Sound measurements: all types of analyses, including, sonar, medical research.

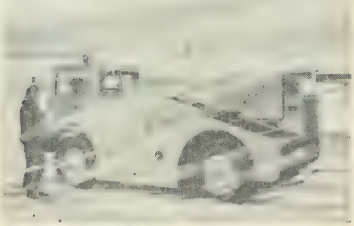
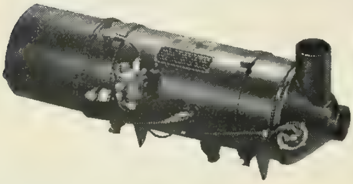
HUNTER ENGINE HEATERS



for military applications at sub-zero temperatures



- designed and produced in accordance with military requirements.
- for starting internal combustion engines at sub-zero temperatures, cold starts to −65°F.
- standard winterization gear for military vehicle engines, generator sets, compressors, hydraulic test stands, battery starting carts, other ground support and special purpose equipment applications.
- burn any type gasoline or JP-4 fuel.
- BTU/Hour range: from 30,000 to 90,000 input, utilizing both uncontaminated air and exhaust.
- compact, light-weight, high capacity units for delivery of high temperature, high-volume air as required for specific applications.

Other Hunter military equipment: space and personnel heaters; instant lighting torches, refrigeration units.

Soviet Affairs

by Dr. Albert Parry

Impressions gathered on my recent lecture tours of the Northeast and the Middle West, both in the United States and Canada, include a curious popular misconception on the subject of the German role in the Soviet rocket effort.

Many Americans and Canadians are sincerely convinced that the Soviet successes in rockets and missiles are due predominantly, if not entirely, to the work of German experts captured or contracted by the Soviet Union at the end of World War II.

On one occasion in Cleveland, I had carefully explained that only a small portion of the Soviet achievements in the space race can rightfully be credited to German help when a listener ventured this interesting psychological explanation of the misconception:

"We Americans remember so well that we licked the Germans twice—in World War I and World War II. Now, consciously or not, we tell ourselves that it isn't really the Soviet Russians but the very same Germans who are again trying to challenge us. The same Germans, but in the guise of Red Russians! And we reassure ourselves that just as we licked the Germans in the two World Wars, we will lick them a third time, if there is a third time."

This popular American picture of Germans-in-the-guise-of-Soviets has already reached Khrushchev. Outraged, he found it necessary to deny the charge in his recent Minsk speech. Nikita pointed out that while Germans had indeed been used by his government in rocketry and other scientific and engineering fields, it was only "a small group of Germans," and that "on the termination of their contracts they have either returned or are now returning to Germany."

Moreover, Khrushchev emphasized the role of Germans in the U.S. rocket field. Following his lead, the Soviet press at once began to stress the number and importance of such German experts in American service as Dr. Wernher von Braun and his associates.

•

The successful launching of our *Explorer*, under von Braun's guidance, is now being used by the Soviets in their own version of America's post-*Sputnik* game: "It is Germans, not Americans, who produce whatever rockets, missiles and earth satellites the capitalist world has!"

To use the psychological explanation of the man in my Cleveland audience, by this time the Soviet Russians may also be guilty of the same attempt at self-assurance and saying in effect: "We Russians licked those Germans in World War II (if not in World War I). We will lick those Germans again even though they assume the guise of Americans on that Cape Canaveral base!"

Another self-consoling illusion I found among my American and Canadian audiences appeared in the form of a question I was frequently asked: "Isn't it true that most Russian scientists in the rocket and atomic field are men in their fifties, sixties and even seventies? Doesn't this mean that younger Soviet scientists and engineers are not as good as they are often described—that they cannot continue the successes of their elders and therefore are of no real competition to the West?"

My answer, of course, was that there is plenty of young blood among Soviet rocketeers and nuclear physicists—that under no circumstances must we lull ourselves into any false sense of security on this score.

Moscow Briefs

From October 4 to January 18, a total of 91,569 letters and wires, addressed "Moscow—*Sputnik*," was received by the Soviet Academy of Sciences. This number includes letters, postcards and wires from 58 foreign countries. In addition, more than 300 packages arrived containing photographs, tapes and records registering both *Sputnik*s in picture and sound. Nearly 1300 persons, from both Russia and abroad, wrote volunteering as passengers on the first Soviet flights of the future into outer space, particularly to the Moon.

•

Radio Moscow has begun making space flight programs a regular part of its diet served to North America. The broadcasts give general descriptions of a wonderful era ahead, in which there seems to be a complete absence of any ideological or other conflicts.

•

The initial claim of "Soviet military and scientific superiority" because of their ICBM and *Sputnik*s has been played down in the Russian press. The fact that these events jolted the United States into beefing up its defenses has led the Soviets to change their line and claim that our reaction is due to U.S. "failure to understand the real aims of Soviet science."

•

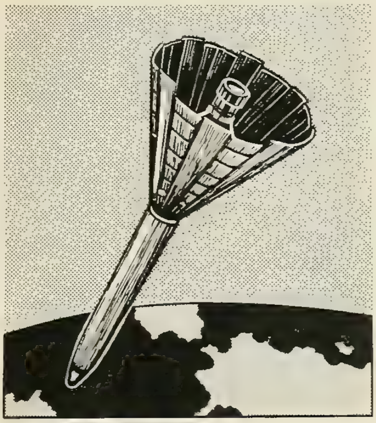
The Soviet Union expects to "hold the first place in the world in the peaceful use of atomic energy by 1960." This is one of the chief points made in the book The Year 1960 by L. V. Zhigarev, just issued in Moscow by the State Political Literature Publishing House. Atomic-energy stations will dot the entire country, says the author, but in the south of the Soviet Union there will in addition be a network of solar powerhouses, creating "a veritable revolution in industrial energy."

•

The Moscow Mint is preparing a special miniature emblem in honor of *Sputnik* I, to be worn in coat lapels, apparently by those Soviet scientists, engineers, and officials who contributed to the satellite's creation and launching. The emblem shows a globe ringed by a fine strip of gold representing *Sputnik* I's orbit. The satellite itself is marked by a small red spot on the gold strip.

•

"Sovetskaya Aviatsia," the official newspaper of the Soviet Air Force, has been paying respectful attention to American ideas and research that tends to discard the sharp nose cone of a rocket or ICBM in favor of blunter shapes for re-entry purposes. These blunt shapes, the article notes, have a much better chance of surviving the plunge through the atmosphere at re-entry velocities. A recent article in the publication was accompanied by the above illustration and gave approving treatment to blunt-nose rocket projects.



•

A vicious attack on Dr. Wernher von Braun was published by the Moscow *Komsomolskaya Pravda,* the official organ of the Communist Youth League, on January 26, or five days before the *Explorer* went up into its orbit.

Entitled "Father of V-2, Servant of Hitler and the Pentagon," the prominently featured article included two photographs, one showing Dr. von Braun in the early 1940s present at a tour of inspection by some Nazi generals, the other—a recent photo—showing him at a conference with American generals and officials at Huntsville.

The article, signed by I. B. Biryukov, charges that just as Dr. von Braun used to answer Nazi greetings by exclaiming "Germany Above All!", so now he shouts "Wall Street Above All!" The Soviet writer declares that Dr. von Braun tries to be "a faithful Columbus" with his discoveries for American rocketry, but that "he is no prophet" and is therefore wrong in predicting victory for the United States over the Soviet Union "and the world."

Dr. von Braun is invited by the *Komsomolskaya Pravda* journalist to "remember his defeat of 1945" as a lasting lesson for his part in the American race against Soviet rockets and missiles.

•

The death of Dr. Sergei V. Orlov, one of Russia's oldest and most famous astronomers and astrophysicists, has been reported in Moscow. A professor at Moscow University, Orlov was the author of many works on comets and other subjects. Director of the Shternberg Astronomical Institute attached to Moscow University, he was known not only for his scientific achievements but also for his training of numerous young Russian astronomers and astrophysicists now serving all over the USSR. Dr. Orlov was 77 at his death.

•

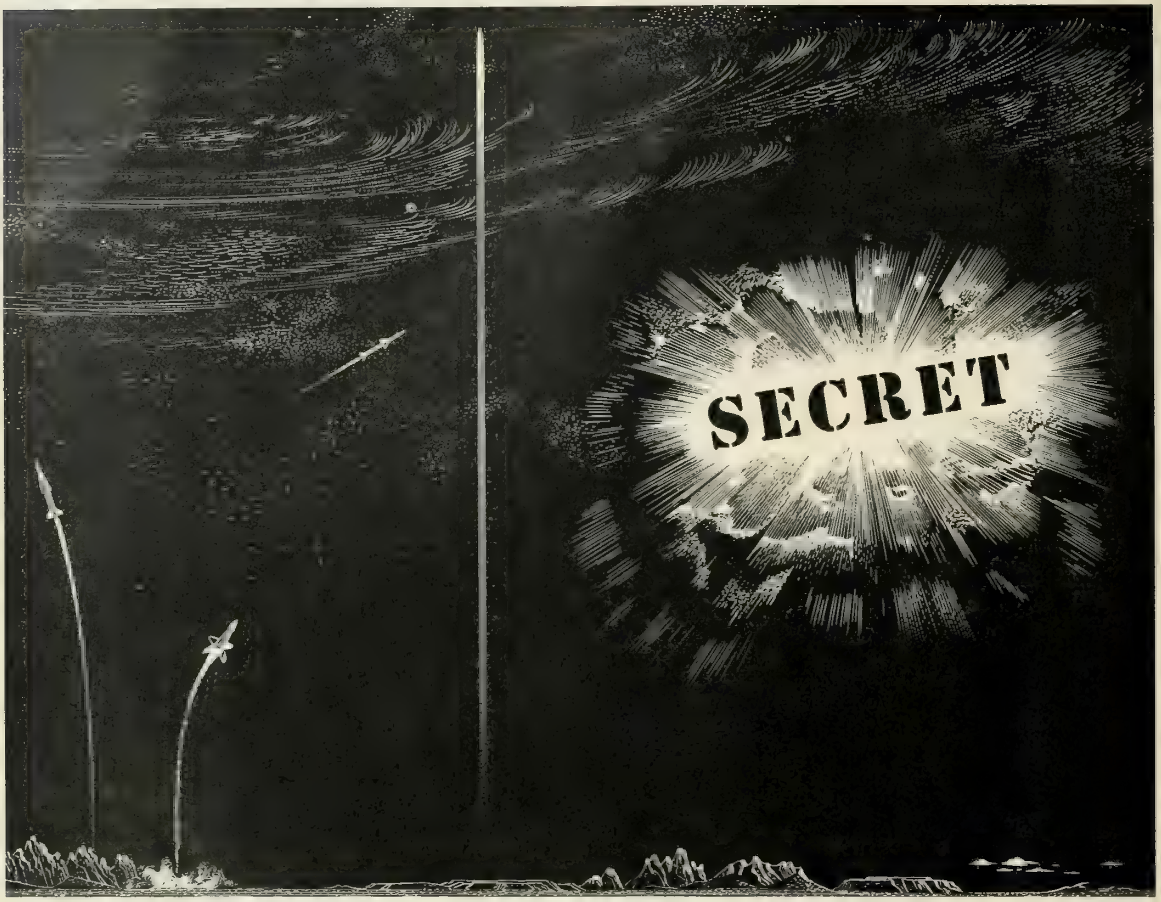
The Moscow "Literaturnaya Gazeta" castigates Professor S. F. Singer of the Physics Department at the University of Maryland in a special unsigned article entitled "Atom Warmongers in Outer Space."

While recognizing Professor Singer "for his works in the field of astronautics," the Russian article attacks his "report at the International Congress of Astronauts in Barcelona of last October wherein he advocated moving H-bomb tests from Nevada to the Moon."

The Soviet writer sees in this project "an opportunity for an unlimited increase of the might of nuclear arms, which is a fond dream of the gentlemen of Washington."

WHY DOUGLAS ENGINEERS AND SCIENTISTS GO FURTHER...

At DOUGLAS, you'll work to expand the frontiers of knowledge in today's most advanced missiles program



1. Nike 2. Honest John 3. Sparrow 4. Thor IRBM 5. Secret 6. Secret 7. Secret 8. Secret

It's no secret that we're in the "missile business" to stay...with seventeen years behind us and an ever-expanding future ahead

There can be no mightier challenge than to be assigned to any one of the major projects now under way in the Douglas Missiles Division.

Some – like Nike and Honest John – have pioneered missile development. Others on which Douglas engineers are engaged are extending the horizons of present-day development...cannot be mentioned for reasons of national security.

These are the projects that require engineers who are looking far beyond tomorrow. You will use all of your talents at Douglas and have the opportunity to expand them. Your only limitations will be of your own making. Douglas is an engineer's company...run by engineers. Make it your working home and build an important and rewarding future in your field.

For complete information, write:

DOUGLAS AIRCRAFT COMPANY, BOX 620-R
SANTA MONICA, CALIFORNIA

GO FURTHER WITH DOUGLAS

FIRST IN MISSILES

Precision Instruments Are Core of Rocket Test Track

ALAMAGORDO, N. Mex.—The new 35,000-foot rocket track at the Air Force Missile Development Center will make extensive use of precision and versatile electronic instrumentation in its test program.

The purpose of the track is to collect data on the performance of missile and aircraft components, but because the average run will take only a few seconds, and because it will involve thousands of dollars in components, propulsion, and engineering man-hours, the collecting and recording data has to be of the highest quality. A vast net of ground lines, coax cables and radio links joins the blockhouses (3), firing pads, and instrumentation sites to the control and central data-collection building.

Each run requires the measurement of velocity and position of the rocket sled as a function of time. Standard equipment measures velocity with an error of not over one part in 1000 while position can be determined to ±0.1 inch.

Most tests use a permanent space-time system which consists of a small light source and a light-sensitive element carried on the sled. When the light beam is interrupted (by accurately spaced knife edges as the sled passes) a signal is telemetered to the data center where it is correlated and recorded.

For more accurate measurements, a sled-mounted accelerometer in conjunction with space-time data are fed into a computer. The computer processes the data and calculates velocity and position automatically, allowing for the changing travel time of the signal as the sled changes position relative to the data center.

Because of the more extensive data needed during a sled run, telemetry is required. Two telemetry signals are used:

The frequency modulation (FM/FM) system receives and presents transducer data in continuous form with a frequency response up to 3 kc on the upper channels; overall accuracy is over 94 per cent. Accuracy can be increased to 98 per cent with automatic calibration.

The other system, PCM, can hit an accuracy of 99.8 per cent. Here, the analog transducer output is sampled by sled-mounted equipment and converted into digital form for transmission over the PCM system to the data center for recording.

Missile Business

by Seabrook Hull

First there was the sound barrier; then, the heat barrier. Now, in the business of missiles, rockets and space flight another barrier rises: the dollar barrier. Simply put, the question of mounting concern in Washington is "Can we afford it?" And that's a dilemma that may well explain the delay in getting the country off top dead center in its efforts to catch and leapfrog Russia in advanced weaponry and modern technology.

The inescapable fact is: If you take all the programs and projects now pushed as essential and their costs, you come up with a total that gets frighteningly close to the $1-trillion mark. It would not be hard to budget "essential" projects requiring an annual expenditure equivalent to our entire national debt of some $275 billion.

Politically, the public would not stand for the taxes necessary to a pay-as-you-go approach, even assuming we had the scientific and engineering manpower to go around—which we don't. Economically, the country would collapse under any effort to finance it with massive deficit spending. It means that from the point of view of economics spending must be kept down to within "reasonable" levels—say, to $1 billion or less (corrected for inflation) for the whole national budget for some years to come. Politically, the practical total is probably closer to $75 billion—unless and until Russia does something else to scare us.

In terms of programs, it is therefore inevitable that many will be put on the shelf or dropped entirely. It should also mean that duplicate-but-competitive approaches (like *Thor* vs. *Jupiter*, *Wizard* vs. *Nike-Zeus*, etc.) will probably be rationalized down to a single survivor. It could even mean, for example, the cancellation of *Titan,* on the theory that *Atlas* will fill the gap until the solid-propellant ICBM comes along and that we simply can't afford the interim-though-sophisticated liquid-propellant *Titan*. Conversely, of course, it might mean dropping *Atlas,* should *Titan* suddenly show great troublefree promise in flight test.

It takes only simple arithmetic to see the reasoning involved. Though a comprehensive listing of missile-age prices is still a closely guard military secret—on the theory that contracts divided by unit prices give numbers ordered—enough has been released and/or surmised to demonstrate the present costliness of missile and rocket weapon systems.

One military estimate of the number of *Bomarc*s and their sites needed to fully protect this country rounds out at around the $10-billion mark; a single operational ICBM squadron, at about $1 billion. *Polaris*-launching submarines cost, in production, $80 million each without missiles, according to preliminary estimates. And, there's serious talk of building 100. The anti-missile missile will cost at least $1 billion just to develop, much less place in operational status. Ordered-in-volume air-to-air missiles range in price from $1200 to over $50,000 each, not including those with nuclear warheads. And, we haven't even begun to price a progressive space flight program! Nor have we included maintenance costs, pay and allowances for troops, industrial mobilization, education, etc.

A sharp thinking-through of our current and future military and space flight program is dictated not only by the limited dollars available, but also by limited, specific industrial capacity (forging and heat-treating, for example), and by the short supply of technical manpower.

In a word, the United States is forced to abandon the shotgun approach. Instead it must be highly selective—a new experience. This will have a profound affect on the missile business and should help provide an explanation for some of the "rather odd" decisions that may come out of Washington.

washington trends

by Elizabeth Oswald

A NEW STEP IN THE PLAN to develop an orbital bomber is expected "pretty soon." In Air Force parlance "pretty soon" means from two to three weeks, up to possibly six months.

Study is being made of proposals submitted by major aircraft companies, one from Bell Aircraft, first in the field to study under AF contract the possibility of using powerful rocket engines to boost an aircraft into space, at which point the pilot would take control. The vehicle would be capable of bombing any place on earth from outer space under pilot control, reentering the earth's atmosphere by use of a skip-glide technique.

ARDC officials are not convinced the project is feasible after studying proposals from Douglas Aircraft, Bell, North American Aviation, Northrop Aviation and Republic Aircraft. What could come next is a phase I design competition. Boeing Airplane Co. also has made a study of an unmanned ballistic rocket bomber for televised reconnaissance work.

ARMY-AIR FORCE BATTLES over the roles they will play in the development and operation of air defenses aren't over. Air Force wants a new look taken at the Defense Department decision which calls anti-missiles a "point defense" function, and gives the Army the job of developing *Nike-Zeus* as an anti-missile missile. AF claims that the missile can't properly be separated from its radar command and tracking equipment or its detection equipment. As of now split responsibility exists with AF responsible for the development of the detection equipment. It will also argue that a "point defense" weapon would require astronomical numbers of men and locations to protect such cities as New York or Los Angeles.

USE OF THE FIRST AIR-LAUNCHED solid-propellant ballistic missile may come with the production of the WS-110A, now known as the B-70. Chances are that the missile will not be a "sawed-off *Polaris*." Current thinking is that the WS-110A will carry both air-to-ground missiles and an intermediate-range ballistic missile. The air-to-ground missiles would be slung under the wings, with the ballistic missile carried in the bomb bay. This way, the Strategic Air Command expects to be able to pick off more than one target on each mission.

UPPER AIR RESEARCH conducted by the AF's Cambridge Research Laboratory is responsible for a big, and expensive project which is scheduled to continue until February 1, 1960. The balloons start at the Navy auxiliary field at Vernalis, Calif., and are scheduled to float east. Some of the bigger balloons reportedly will stay up for about 10 days. Details of the program are classified.

NEW PUSH FOR CONSTRUCTION of 100 submarines to carry the *Polaris* will run afoul of the limited submarine construction capability which now exists in the United States. Lead yard for such construction is that of the General Dynamics Electric Boat Co. at Groton, Conn., which will build two of the first three *Polaris* submarines. Other yards with a submarine capability are Mare Island which will build the third *Polaris* sub, the Naval Shipyard at Portsmouth, N.H., Newport News Shipbuilding Co., Newport News, Va., and Ingalls Shipbuilding Co., Pascagoula, Miss. The accelerated submarine construction program will take just under two years to produce its first submarine.

ROY W. JOHNSON, CHIEF of the newly created Advanced Research Projects Agency, won't have any fix on what the new organization will be until after April 1, when he comes to Washington full time. As of now his only certain needs are a top-notch scientist who, he says, won't come from General Electric Co., and a military assistant.

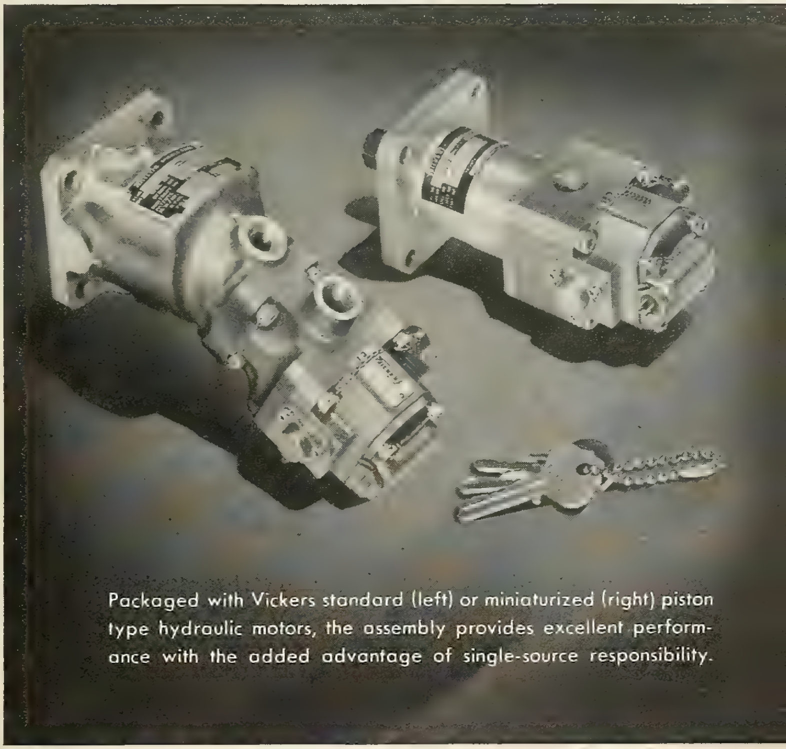
New VICKERS® SERVO VALVE

Designed primarily for aircraft and missile applications, the new Vickers Electro-Hydraulic Servo Valve has numerous features (see above) that assure optimum performance and dependability.

Porting modulated flow to linear or rotary actuators with respect to minute input current has been optimized within a small envelope and at a weight that is approximately 30% less than other valves of similar capacity. Design also provides for interchangeability with many existing servo valves now used in airborne applications. For further information, ask for technical bulletin number SE-98.



Packaged with Vickers standard (left) or miniaturized (right) piston type hydraulic motors, the assembly provides excellent performance with the added advantage of single-source responsibility.

MAGAZINE OF WORLD ASTRONAUTICS

1958 Missile Materials Review

a report on industry use and development of present and future materials

by Alfred J. Zaehringer and Raymond M. Nolan

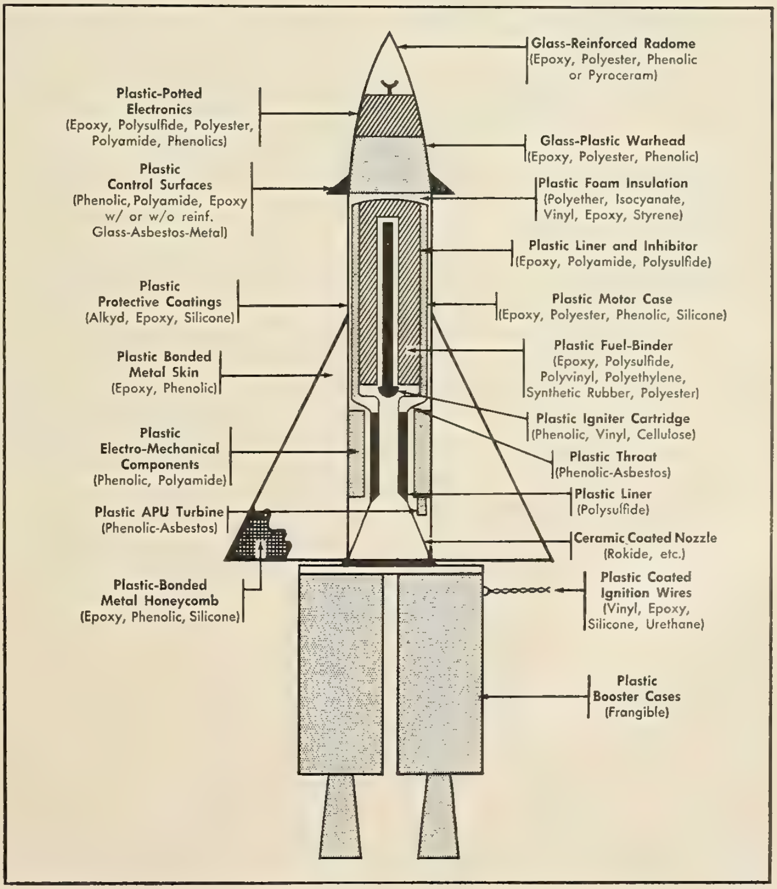
TODAY THE AMERICAN missile industry has available a myriad of missile materials, many of which existed only on paper 10 years ago. Others, specifically developed for missiles, are, in some cases, only a few years old. Newcomers in the missile business expect this wide variety of materials, but oldtimers are prone to overlook some of the amazing properties available.

Day by day, new products are rapidly being added to this materials spectrum. These materials developments, coming at a critical time in our race with the USSR, now offer us two choices: we can take advantage of the ready availability of the new materials to offer superior missiles, or we can let these new materials fall by the wayside and thus fall even farther behind the Soviets, who are exploiting every conceivable new material and technique.

The key materials categories reviewed in this issue will be the old standby metals, the newer missile-age metals, the fast-moving plastics, ceramics, nuclear shield materials, and materials for lubricants and hydraulics.

Missile Metals

In the early days of rocketry, the fabricator was likely to make his rocket from any old chunk of steel or aluminum lying in the bare stockbin or in the scrap heap. Pre-World War II philosophy (and to a lesser extent during the war) seemed to be that the



Glass-Reinforced Radome (Epoxy, Polyester, Phenolic or Pyroceram)
Plastic-Potted Electronics (Epoxy, Polysulfide, Polyester, Polyamide, Phenolics)
Glass-Plastic Warhead (Epoxy, Polyester, Phenolic)
Plastic Control Surfaces (Phenolic, Polyamide, Epoxy w/ or w/o reinf. Glass-Asbestos-Metal)
Plastic Foam Insulation (Polyether, Isocyanate, Vinyl, Epoxy, Styrene)
Plastic Liner and Inhibitor (Epoxy, Polyamide, Polysulfide)
Plastic Protective Coatings (Alkyd, Epoxy, Silicone)
Plastic Motor Case (Epoxy, Polyester, Phenolic, Silicone)
Plastic Fuel-Binder (Epoxy, Polysulfide, Polyvinyl, Polyethylene, Synthetic Rubber, Polyester)
Plastic Bonded Metal Skin (Epoxy, Phenolic)
Plastic Igniter Cartridge (Phenolic, Vinyl, Cellulose)
Plastic Electro-Mechanical Components (Phenolic, Polyamide)
Plastic Throat (Phenolic-Asbestos)
Plastic Liner (Polysulfide)
Plastic APU Turbine (Phenolic-Asbestos)
Ceramic Coated Nozzle (Rokide, etc.)
Plastic-Bonded Metal Honeycomb (Epoxy, Phenolic, Silicone)
Plastic Coated Ignition Wires (Vinyl, Epoxy, Silicone, Urethane)
Plastic Booster Cases (Frangible)

Fig. 1—Plastics components for a typical multistage solid-propellant missile of the near future.

Table I: Workhorse Metals

Metal	Melting Point (°C)	Boiling Point (°C)	Specific Gravity	Use
Aluminum	670	2057	2.7	Standard lightweight alloys
Chromium	1615	2200	7.1	Plating, stainless steel, high strength and corrosion resistance at high temps.
Cobalt	1495	3000	8.9	High-strength, hi-temp. alloys, supermagnets
Copper	1083	2300	8.9	Electrical conductor, alloys
Gold	1063	2600	19.3	Alloys, plating, solders
Iron	1535	3000	7.8	Steel, metal standard
Lead	327	1620	11.5	Solders, radiation shields
Magnesium	651	1110	1.7	Low-weight metals and alloys
Manganese	1260	1900	7.2	Alloy steels, Al, Cu
Nickel	1455	2900	8.9	Stainless steels, corrosion-resistant alloys (Monel, Inconel, etc.)
Silicon	1420	2600	2.4	Rectifiers, solar battery, iron alloys, silicones
Silver	960	1950	10.5	Brazing alloys
Tin	232	2260	7.3	Plating, solder
Zinc	420	907	7.1	Alloys, plating

rocket missile could only be justified if it could be made from the remnants of other weapons. Gradually, however, there evolved specific metals and fabrication techniques (many of them borrowed from the aircraft industry) which apparently reached their zenith during the critical shortages of World War II and the Korean conflict. Much to the chagrin of postwar missilemen, who had finally mastered the available materials, metals did not revert to the old standards. New propulsion systems, higher temperatures, higher flight speeds and newer materials again made the metal masters hop.

Aluminum, and to some extent the magnesium alloys, have gained somewhat in overall structural application, but the trend toward higher operating temperatures and high-Mach-number flight regimes has forced the swing back again to the steels.

Specifically, the stainless steels are now in the spotlight. Table I lists some of the workhorse metal elements. Steel is still our number one metal. However, the more exotic missile metals (Table II) are beginning to take shape and will find increased application, particularly in the nuclear field.

Here is a review of the metals scene as reflected over the past year:

Aluminum. High-Mach-number flight has dulled aluminum structural applications but newer alloys are coming up. According to Alcoa, the U.S. will consume three million tons of this metal by 1958. Typical of the new alloys is 5086, introduced by Kaiser Aluminum & Chemical (4% Mg, 0.45% Mn, 0.1% Cu), which is not affected by welding and whose tensile is 38,000-47,000 psi. North American Aviation's cast aluminum alloy, called Tens-50, which is slated for missile use, is being poured by Rayson Foundry in Los Angeles.

Beryllium. NACA Ames Aeronautical Laboratory believes that this metal has promise for ballistic-missile nose cones. It finds beryllium six times better than copper on thermal and weight bases. Beryllium is considerably better than graphite but has problems with brittleness and difficult fabrication techniques for large sections.

Chromium. This is still a vital component of most modern stainless steels.

Cobalt. Metal is commonly used in high-temperature superalloys.

Copper. Copper alloys such as bronze are getting a new, close look for missile applications. Ampco Metals of Milwaukee has introduced Superstan 40, an aluminum bronze, iron-manganese superbronze. Castings give tensiles of 98,000 psi while the wrought metal is 135,000 psi.

Hafnium. Hopes are that the reactor grade will drop from the present \$50/lb. to \$20/lb. AEC, Bureau of Mines and Westinghouse are optimistic about hafnium in reactor controls.

Iron. In the form of steel, iron is still the backbone of the entire metals industry. However, pure crystals of iron show exceptional properties. Westinghouse Research Labs has measured tensile strengths of 500,000 psi for thin hairs of pure iron.

In 1957, actual production of steel in the U.S. was 120 million tons; capacity, 133 million tons. Presently 15 million tons of added capacity are under construction. The quality of steel has never been higher. Ore reduction is underway with United States Steel and Bethlehem experimenting with a direct iron ore reduction process. Stainless steel is the iron leader, with \$75 million going into aircraft and missiles in 1956, by 1960 up to \$200 million per year. Currently, stainless steel runs about \$2/lb. in common fabrications.

A new steel for Mach-4 flight—PH 15-7 MO by Armco Steel—will take temperatures of 1000°F. Ultimate strength at 1000°F is 129,000 psi. Composition is 15% chromium, 7% nickel, and 2.5% molybdenum.

Lithium. Present lithium cost is about \$10/lb. Newest alloy is X2020, an Alcoa lithium-aluminum metal. It has high strength up to 400°F and is 3% lighter than conventional aluminum aircraft alloys. This Li-Al alloy could raise the flight cruise level from Mach 2 to 2.5.

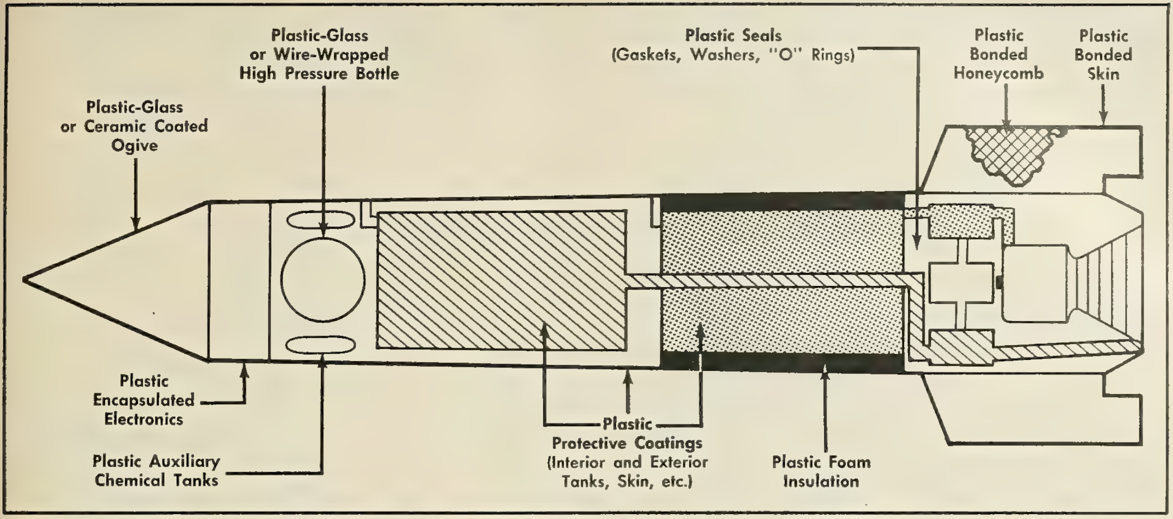
Magnesium. Of the 61,000 tons of primary magnesium produced in the United States in 1955, 36,000 tons were used in structural applications. Alloyed with aluminum, it gives corrosion-resistant and heat-treatable metals. It is used in canning uranium fuel elements and is most vital in the production of titanium. Ten thousand tons of magnesium were used in titanium reduction processes in 1955.

The B-58 uses a magnesium-thorium alloy 33% lighter than aluminum that has good rigidity and is heat-resistant. Hot forming has aided sheet bending but machining is still a problem with this slightly radioactive alloy. Dow Chemical is now extruding large-diameter magnesium missile fuselages for the Air Force at Madison, Ill. In addition, Dow's presses can make 20-inch widths, 24-inch OD tubing and large "I" beams. Dow has also introduced its HM21XA-T8 magnesium sheet. Containing 1.5-2.5% thorium and 0.35-0.80% manganese, the magnesium alloy has a tensile strength of 20,000 psi at 600°F.

Brooks and Perkins of Detroit have delivered magnesium spheres for the *Vanguard* satellite project.

Manganese. Now going into stainless steel, this element is usually alloyed with small amounts of nickel. Types 201 and 202 manganese steel are comparable in properties to the standard 18-8 stainless.

Molybdenum. "Moly" is finding increased missile applications. The Naval Ordnance Laboratory (Silver Spring, Md.) has developed "Thermenol," a nonstrategic moly steel. It contains 3-4% Mo and 15-16% Al and has better strength over 450°F than RC 130A titanium alloy. "Thermenol" is 17% lighter than 17-7PH stainless and can be used for compressor blades, heating elements, and missile skins.



Plastic-Glass or Wire-Wrapped High Pressure Bottle
Plastic Seals (Gaskets, Washers, "O" Rings)
Plastic Bonded Honeycomb
Plastic Bonded Skin
Plastic-Glass or Ceramic Coated Ogive
Plastic Encapsulated Electronics
Plastic Auxiliary Chemical Tanks
Plastic Protective Coatings (Interior and Exterior Tanks, Skin, etc.)
Plastic Foam Insulation

Fig. 2—Plastics components for a typical large liquid-fueled rocket. Some specialized missiles may be 85 per cent plastic in a few years.

Climax Molybdenum has come up with a 99.5% Mo, 0.5% Ti alloy which has high strength above 1600°F. (Tensile is 132,000 psi at room temperature and 88,300 at 1600°F.) The metal has also shown considerable promise as a slipper for rocket sleds and its performance may be related to the formation of molten molybdenum oxide, which has a low coefficient of friction.

Climax has been working for some time on a contract with WADC to develop oxidation-resistant coatings for moly. Several coatings (aluminum-chromium-silicon up to 2600°F, nickel base up to 2200°F) have proven satisfactory, but no coating has been developed which combines ballistic and thermal impact with good erosion- and oxidation-resistance.

Nickel. U.S. consumption of this high-temperature alloying ingredient was about 300 million pounds in 1957; by 1960 it will be 450 million pounds. It is widely used in turbine blade alloys and in stainless steel for missile skins. Haynes Stellite Co. (Kokomo, Ind.) developed a high nickel alloy (with chromium, moly, silicon, manganese, titanium and aluminum) which has a tensile of 90,000 psi at 1500°F and 22,000 psi at 1800°F. Meanwhile, International Nickel Co. predicts a nickel steel (possibly with vanadium, moly, silicon, titanium and carbon) with a tensile strength of 300,000 psi.

Niobium. Also known as columbium, this missile metal is a fast mover and many firms are scrambling to produce the element which might permit engine-temperature operating increases on the order of 500°-1000°F. Its immediate use would be for turbines, where it might make 2000°F operation possible. (Present level is about 1650°F.)

Use in nuclear reactors as well as rocket engines is seen. For example, the USSR already is said to be applying niobium for rocket engines. Kennecott Copper Co. is one producer of niobium ore with zirconium and hafnium as byproducts.

Westinghouse Research Labs is using a zone refining process to produce pure niobium. DuPont and Thompson Products are teaming up to develop fabrication techniques for high-strength niobium alloys. Also in the niobium race are the Bureau of Mines (now studying niobium separation methods) and a host of producers in various

Table II: Missile-age Metals

Metal	Melting Point (°C)	Boiling Point (°C)	Specific Gravity	Use
Beryllium	1350	1500	1.8	Cu and Al alloys, neutron moderator
Boron	2300		3.3	Hardening steels, boron carbide, delay action fuzes
Cesium	29	670	1.9	Ion rockets
Gallium	30	1600	5.9	Heat transfer for atomic rockets
Germanium	958	2700	5.4	Rectifiers and transistors
Hafnium	1700	3200	13.3	Nuclear reactors
Indium	155	2000	7.3	Seals, alloys, solders, neutron indicators for atomic rockets
Iridium	2350	4800	22.4	Electrical contacts, electrodes
Lithium	186	1220	0.5	Li-6 for H-bomb, heat transfer, alloys
Molybdenum	2620	3700	10.2	High-temp. metals and alloys
Niobium	2500	3300	8.4	High-temp. alloys
Osmium	2700	5300	22.5	Hardener for platinum
Palladium	1553	2200	12.6	Contacts, spark plugs
Platinum	1773	4300	21.4	Thermocouples, contacts, electrodes
Rhenium	3000		20.5	Thermocouples, contacts, electrodes, corrosion-resistant alloys
Rhodium	1985	2500	12.5	Thermocouples
Ruthenium	2450	2700	12.2	Contacts
Tantalum	2996	4100	16.6	Resistors, high-temp. alloys
Thorium	1845	3000	11.3	Nuclear fuel, alloys
Titanium	1800	3000	4.5	Alloys
Tungsten	3370	5900	19.3	Tool steels, filaments, high-temp. alloys
Uranium	1150		18.7	Nuclear fuel
Vanadium	1710	3000	5.96	Alloys
Zirconium	1900	2900	6.4	Corrosion-resistant alloys, low neutron absorber

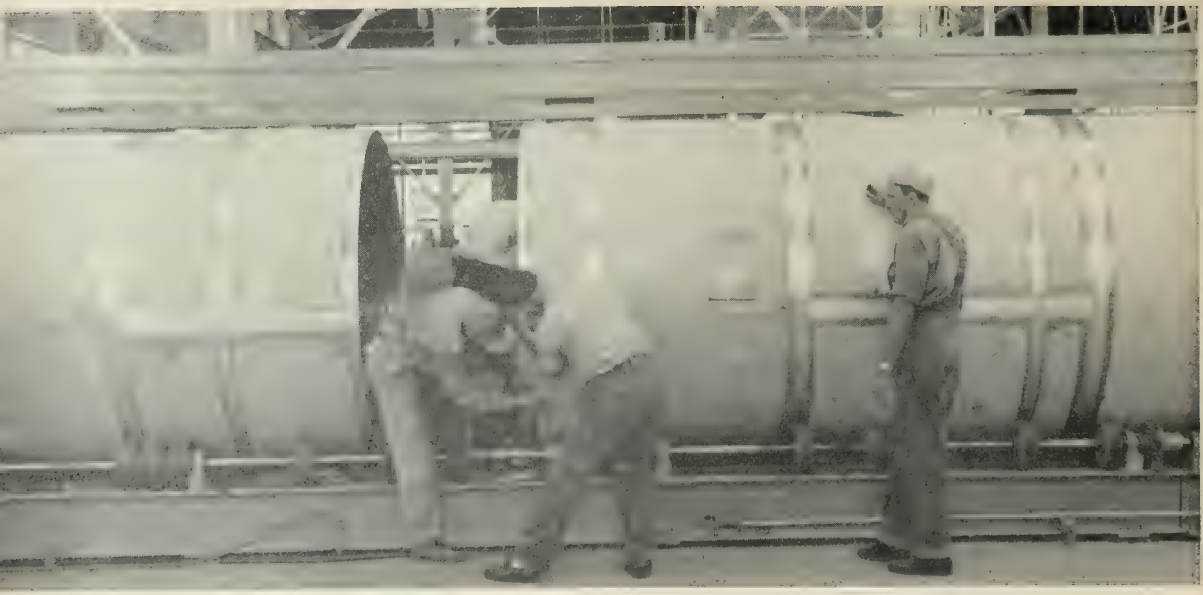


Fig. 3—Workmen welding sections of the JUPITER-C. New techniques have contributed many diverse uses of both old and new metals.

stages of production readiness (Kawecki, Electro Metallurgical, Horizons Titanium and National Research). Kawecki and Fansteel are said to be in actual production. Fansteel is supplying niobium to AEC, as is Shieldalloy.

Kennametal has supplied 7500 pounds of niobium to AEC; a like amount was delivered by the Wah Chang Corp. Biggest niobium aggregate shaping up will be the team-up of National Distillers & Chemical, Mallory & Co., and Sharon Steel Corp. to develop and manufacture niobium as well as titanium, zirconium, hafnium, and tantalum.

Rhodium. Sel-Rex Precious Metals of Belleville, N.J., has a new rhodium electroplating process which eliminates cracking and peeling. The Albany Plating Co. of Chicago uses rhodium for durable plates over brass.

Table III: Comparison of Metals and Plastics

Material	Density (lb./in.^{3})	Strength (psi)	Strength/Density Ratio
Mild steel	0.283	65,000	230,000
Aluminum (75ST)	0.10	85,000	850,000
Titanium alloy	0.16	90,000	560,000
Heat-treated steel alloy	0.283	180,000	635,000
Strongest steel alloy	0.283	225,000	795,000
Present glass-plastic	0.06	55,000	915,000
Future glass-plastic	0.065	75,000	1,150,000

Table IV: Thermosetting Plastics for Missiles

Resin	Estimated U.S. 1957 Production (million lb.)	Missile Uses
Alkyd	490	Coatings
Epoxy	36	Coatings, laminates, bonding, tooling, potting
Phenolic	580	Coatings, laminates, bonding, shell molding, tooling
Polyester	100	Laminates, radomes, potting, tooling
Silicone		Laminates, seals
Urea & melamine	340	Parts & moldings

Thermoplastic resin uses include films (cellulosics), windows (acrylics), mechanical parts (nylon), fixtures (high-impact styrene), paints & seals (vinyl), foams (urethanes), piping (polyethylene), seals (Teflon), etc.

Silicon. In addition to silicon going into steels and silicones, the purer forms have valuable nonstructural applications. Westinghouse Electric Co. is producing superpure silicon for resistors. The Raytheon Mfg. Co. produces silicon for infrared detectors. DuPont's facilities in North Carolina last year produced 50,000 pounds of semiconductor-grade silicon and 20,000 pounds of solar-battery grade.

Bell Telephone Labs has produced high-purity silicon by zone refining. This process uses commercial silicon at half the cost of the purer semiconductor grade. Bell uses the silicon for rectifiers and transistors.

Thorium. Used in nuclear reactors and for fuel elements, thorium is now produced at a 1,000-ton/year rate. AEC sells reactor-grade thorium for $20/lb. Metal Hydrides has produced pure thorium in a new iodide crystal process and forecasts a tonnage cost of $10-15/lb.

Titanium. Though its cost is still high in fabricators' hands (about $20/lb.), its high-temperature characteristics and lower density are making it standard for many missile applications. Titanium sponge is now at the $2.25/lb. level and hopes are to bring it to under $2/lb. soon.

Two new plating processes have been evolved which show considerable promise for missile hardware. The Missouri School of Mines, working under WADC contract, has a process for plating titanium on low carbon steel. The National Bureau of Standards and Springfield Armory have chrome-plated titanium to give an oxidation-resistant, nongalling bearing surface.

Zirconium. Sponge production in 1957 was about 2.7 million pounds; by 1958, will be 5.7 million pounds. A partial list of 1958 producers includes United States Industrial Chemicals (2 million pounds), Columbia-National (0.8 million pounds) and Carborundum Chemicals (1.5 million pounds). USI has made available a non hygroscopic and nonpyrophoric zirconium in plate form, hafnium-free, in diameters up to one inch.

Plastics Push

Some twenty years ago plastics emerged big-scale on the materials scene. They have grown to a 4.5-billion-pound production item in the U.S. during 1957. By 1960, U.S. production will jump to 5.7 billion pounds per year. Yet plastics have had a difficult time breaking into the missile market. During World War II, the most that plastics contributed to rockets were igniter cases that vaporized in a few milliseconds.

Then reinforced thermosets came along. But how could a plastic be used at rocket temperatures when it "fell apart" at one-tenth that temperature? The early Chinese powder rockets gave us a clue. Black powder was burned at 5000°F in ordinary paper tubes. Some paper burned away, but the charring produced carbon, which prevented fast burning. This opened the door to plastic motors, nose cones, radomes, fins and fuselages. The key was the lower thermal conductivity of the plastic, coupled with charring or burning in parallel layers.

Thompson Fiberglass Co. of Los Angeles reports the following achievements for plastics in rockets:

a. Nose cones that can withstand 750°F for 30 minutes.
b. Fin units on high-Mach-number boosters that handle 2400°F for one minute.
c. Phenolic laminate rocket-motor guide vanes that withstand 4500°F for two minutes.

Also, Raybestos-Manhattan has developed an asbestos-phenolic turbine wheel which operates by direct impingement of solid-propellant exhaust gases (2000°F) for 45 seconds and meets spin tests at 100,000 rpm.

Table III compares plastics with metals, while Table IV lists some of the plastics now being used for missiles. Fig. 1 shows plastics components for a typical multistaged solid-propellant missile of the near future. In Fig. 2 we see that plastics are also making definite inroads on large liquid rockets. Some specialized missiles may be 85% plastic within a few years.

The "big four" in high-temperature plastic applications include:

a. Epoxy for 500°F and short time to 3000°F (4000° to 4500°F with phenolic).
b. Polyester to 400°F, with short time exposure to 3000°F.
c. Phenolic to 500°F, with short durations to 4500°F.
d. Silicone, 500°-700°F and short time to 5000°F.

Typical reinforcing materials used with these plastics are glass fibers ("Fiberglas") and asbestos and quartz fibers. Metal reinforcements have also been used.

The Materials Committee of the Defense Department is looking for the following improvements in plastics for missiles:

a. Reinforced plastics with greater rigidity and hot strength.
b. Cheaper fabrication costs.
c. More uniformity in properties.
d. Better design for reinforced plastics structures.
e. Introduction of more machine methods for high production rates.

Plastics are still expensive (steel $0.10/lb.; aluminum, $0.25/lb.; plastics $0.50-1.00/lb.), but costs can be expected to come down with higher production rates. However, in high-cost items such as missiles, properties are expected to play a dominant role. For example, a current supersonic missile fuselage is being laid out entirely with plastic and will weigh only half as much as a comparable metal unit. Glass-reinforced plastic missile radomes have already proven superior to just about all other materials up to 400°-500°F.

Some of the roles that plastics

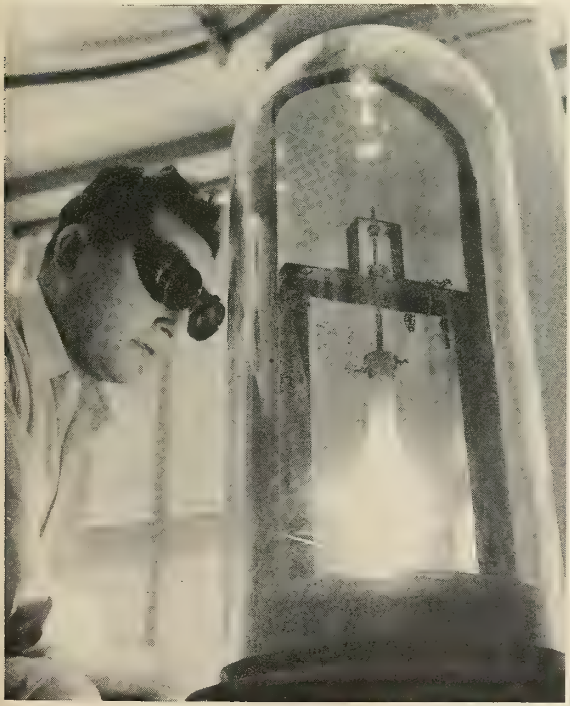

Fig. 4—Testing tensile strength of metals and ceramics.

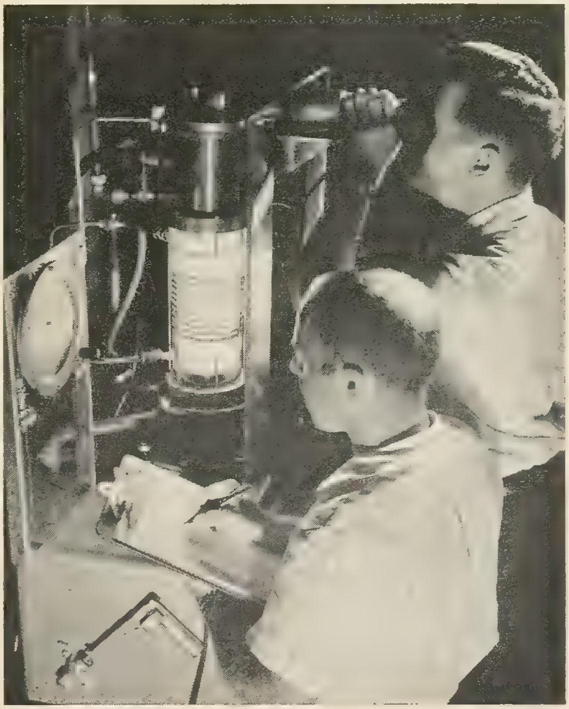

Fig. 5—Purifying niobium by the "cage zone melting" process.

already are playing are outlined below:

Aerojet-General Corp. The warhead on the *Nike-Hercules* will be glass-plastic, produced under a $1.8-million contract.

Bureau of Ships. This U.S. Navy group has put out the call for plastic dielectrics and potting compounds that can take 250°C. Soon it will need materials to sustain 500 hours at 350°C and later 3,000 hours at 500°C.

Carpenter Steel Co., Union, N.J. is turning to the production of chemical polyethylene pipe in one-half to four-inch-diameter sizes. Its PR-150 can take 150 psi at 75°F. The United States produced 55 million pounds of plastic pipe in 1956.

Continental-Diamond Fibre, Newark, Del., has plastic nose cones which can take sustained temperatures of 400°F, and also glass-base, metal-clad laminates of Teflon and epoxy for printed circuits.

Corwin Polymer Products, New Haven, Conn., is developing heat-resistant urethane foams in the 500°-600°F range. These foams can now withstand up to 400°F with only 2% volume change.

Dow Chemical Co. Silicone-glass laminates now used on the B-58 are being considered for *Jupiter* nose cones made of seven to ten layers. Tests show that four to five layers burn but the remainder maintain structural integrity.

Mic-Lin Co., Maple Shade, N.J. A Teflon plastic hose encased by a stainless steel braid can take 4000 psi at 500°F. It is flexible down to −100°F and comes in diameters of 3/16 to 1 1/8 inch.

M. W. Kellogg Co., in cooperation with BuOrd and Allegany Ballistics Lab, has developed entire motors (case, nozzle, heads) for solid-propellant RATO and booster rockets.

NACA and Forest Products Lab have done considerable work with metal-bonding plastics. They find epoxies give good strengths to 250°-300°F. Phenolic-cured epoxies have good resistance to thermal softening to 600°F and good resistance to thermal degradation for 200 hours at 550°F. Glass-cloth-plastic honeycomb cores have proven out at 500°-700°F.

Naugatuck Chemical. Polyesters with 10-25% maleimide result in glass fiber laminates with flex strengths of 36,000 psi while maintained at 500°F for one week.

Pastushin Aviation Corp. produces centrifuge-spun moldings of glass-plastics for radomes, missile containers and drop tanks. Present techniques permit production of sections 10 feet long of four-and-one-half-foot diameter. Wall thickness, up to one-half inch, can be controlled to ± 10% thickness. Typical properties of spun parts are tensile, 17,200 psi; flex, 30,700; specific gravity, 1.77. Twelve parts per week can be produced. Tooling leadtime is 45 days.

Raybestos-Manhattan. A six-and-one-half-foot-long (30-inch-diameter base) nose cone of asbestos-plastic that can stand temperatures of 1000°F is being produced for the *Vanguard* vehicle. Other plastic parts for *Titan, Tartar, Terrier, Sidewinder* and *Polaris* are in work.

Shell Chemical Corp. Its Epon 422 tape (epoxy-phenolic) is used to bond metal to core on B-58 panels and has operating temperature ranges of −70° to 500°F.

St. Louis University. Borazine (boron-nitrogen polymers) point to newer high-temperature plastics.

University of Tokyo. Prof. Hideo Itakawa reports the successful firing of

Table VI: High-temperature Coatings

Name	Company	Temp. Limit (°F)	Coating	Base	Uses
Flame Alumina A	Armour Research Foundation (Chicago, Ill.)	3650	99% Al_2O_3		Rocket nozzles, storage tanks
Flame Alumina D		3650	97% Al_2O_3		Pump housings
Flame Ceramic IA		2500	Fe-Al-Ti	Al	
Flame Zirconia		4750	98% zirconia	Carbon	High-temp. impact
Flame Ceramics	Continental Coating Corp. (Chicago, Ill.)	3500	98.6% Al_2O_3 98% zirconia	Mg, Al, Steel	Rocket nozzles, combustion chambers, ducts, burners
		4500	TiO_2		
		3270	Cermets		
Flame Plating	Linde Air Prod. (NY., N.Y.)	1800	99% Al_2O_3	Steel, Al, Ti	Turbine seals
			92% WC, 8% Co	Mg, Mo, Cu	
Flame-rock Ceramics	Montzine Corp. (Chicago, Ill.)	3500	97% Al_2O_3		
Metallizing	Metalweld, Inc. (Philadelphia, Pa.)	1800	Nichrome	Iron, steel	Heat corrosion w/o S
			Nichrome + Al		Heat corrosion w/S
Rokide A	Norton Co. (Worcester, Mass.)	3600	98.6% Al_2O_3	Iron, steel, nickel alloys, copper, alum., Mo, C, Mg, Ti, etc.	Rocket nozzles, chamber liners, tailpipes, etc.
Rokide Z		4500	98% Zirconia		
Rokide ZS		3000	65% Zirconia 34% Silica		
Sprayweld	Wall Colmony Corp. (Detroit, Mich.)	1900-2225	A-B-Ni	Low alloy & mild steel; heat-treated stainless	Bearings
Thermospray	Metallizing Eng. Co. (Westburg, N.Y.)	3700	Al_2O_3	Metals & plastics	
		4600	Zirconia		
	Ryan Aero Co. (San Diego, Calif.)	3500	Ni-MgO	Stainless Steel, Inconel	Afterburners, combustion chambers

a plastic-glass solid-propellant rocket motor. Later rockets will be fired from balloons in IGY tests.

Ceramics Click

Age-old ceramics were known to have proper temperature-resisting properties needed for rockets. Rocketeers, realizing the shortcomings of metals and plastics, turned to the nonmetals (Table V) and found a wealth of high-temperature materials. However, most ceramics lacked the strength and the thermal shock-resisting characteristics of metals. Various techniques, however, were evolved for metal coatings (Table VI). Marriage of metals and ceramics has begun and large-scale rocket applications may not be far off. For example, NACA has mixed aluminum oxide in nickel to obtain good strength without extreme brittleness. The University of California and NACA have studied ductile ceramics such as magnesium oxide. Russia, too, is studying "alloys" of lattices of ceramics and metals and doing much basic research in flexible ceramics.

Some highlights of ceramic missile development include:

Air Force Cambridge Research Center points to silicon carbide transistors operating at 1400°C and frequencies of over 100 mc. Westinghouse and Armour Research are working on this project.

Buffalo Forge has developed ceramic filters in the 1500°-2300°F range which possibly could go up to 3000°F. Good shock resistance and pressures to 225 psi have been successful in submicron particle removal.

Climax Molybdenum Co. has developed a molybdenum disilicide coating for graphite rocket nozzles which gives protection against high-velocity oxidation up to 3500°F. The moly compound is mixed with a phenolic resin, applied to graphite, and heated to 4000°F, leaving a glazed coating.

Fairchild Camera & Instrument Co. has vacuum-evaporated ceramic films for coating camera potentiometers rated at 225°C, with special ones operating at 400°C.

General Electric Co. Borazon is GE's diamond substitute. Boron nitride made in a press at one million psi pressure and a temperature of 3000°F, the material is as hard as natural diamonds and will find use in industrial cutting tools. Borazon, unlike natural diamonds, has good high-temperature oxidation resistance.

Gladding, McBear & Co. Ceramics for radomes can now be produced at tolerances of ±0.001 inch. Aluminum oxide is sprayed on a chrome-plated mandrel, subjected to 30,000 psi and fired at 2200°F. Finally it is machined on a lathe with diamond tools, and then given a finish firing at over 3000°F.

Table V: High-temperature Nonmetals

Material	Density (g/cm³)	Melting Point (°C)
Hafnium carbide	—	4160
Tantalum carbide	—	4150
*Carbon	1.8-3.5	3500
Tantalum nitride	—	3360
Titanium nitride	—	3220
*Titanium carbide	4.3	3140
*Zirconium oxide	5.7	2900
Tungsten boride	—	2880
*Tungsten carbide	16.0	2820
Hafnium oxide	9.7	2812
Vanadium carbide	5.4	2810
*Thorium oxide	9.7	2800
Thorium carbide	8.9	2773
*Boron nitride	2.2	2730
*Silicon carbide	3.2	2700
*Beryllium oxide	3.0	2570
Molybdenum carbide	8.4	2570
*Magnesium oxide	3.7	2540
*Aluminum carbide	—	2200
*Aluminum oxide	4.0	2050

*Now being used or considered for use as a high-temperature material.

Gulton Industries, Metuchen, N. J. Aluminum (24-S and 75-S) can be up-graded to operating temperatures of 1000°F by a new ceramic coating of lithium borosilicate, lithium chromate, and lithium fluoride.

Kraus Research Lab., Cockeysville, Md. Porcelax is an aluminum silicate coating that is baked on at 350°-400°F. It is more resistant to mechanical shock than porcelain and can withstand 1000°F.

Linde Air Products Co. Synthetic sapphires up to three inches in diameter will prove valuable for IR transmitter applications and other infrared missile uses.

Servomechanisms, Inc. Potentiometers and capacitors are vacuum-deposited with ceramics such as aluminum oxide, making them good for 500°C temperatures.

Radiation Shielding

Already of growing importance in reactors, radioisotope handling and irradiation processes, radiation shielding materials for manned aircraft and rockets are receiving considerable attention. Two of the most effective shielding techniques employ distance and mass. Since distance is impractical in flight installations, the search has been for more effective shielding materials, particularly from neutrons and gamma rays.

Hydrogen is one of the best attenuators and captors of neutrons. Boron, lithium, silver, gold, mercury, iridium, and cadmium, among others, are all excellent neutron captors. Unfortunately, only the heavy elements such as uranium, thorium, lead, gold, tungsten, or tantalum have proven good gamma attenuators.

During the past year, three radiation shielding materials have been introduced:

Boral. Alcoa has dispersed boron carbide in aluminum-clad sheets. Neutron shielding power equivalent to 25 inches of concrete is provided by ¼-inch-thick sheets. The material will not stop gamma rays.

Boron stainless steel. Superior Steel Co., Carnegie, Pa. has developed this alloy (18% Cr, 10% Ni, 1% B), with tensile strength of 90,000 psi, which is 15 times more effective in stopping neutrons than ordinary stainless steel. It has been suggested that substitution of boron-10 might increase the neutron-stopping power. Again, this alloy is not a gamma-ray shield.

Leadolene. Produced by Telectro Industries Corp., Long Island, N.Y., this gamma shield consists of 95% lead dispersed in 5% polyethylene. Recent experiments with epoxy resins under gamma radiation up to 10^8 roentgens indicate that there is little change in heat distortion and compressive properties. Highly hydrogenated plastics may provide a breakthrough for lightweight gamma shielding.

Lubes

Present lubricants must operate over a temperature range of —65° to 165°F. According to the Wright Air Development Center, the operating temperature will soon be up to 500°F —a temperature at which conventional hydrocarbon lubricants and hydraulic fluids break down and cause a multitude of operational troubles. And, says WADC, in 5 years we will need lubes operating at 1000°F.

Organics are now getting temperature stability from compounds of boron, phosphorous, fluorine and silicon. Here are some of the materials being investigated for high-temperature lubes:

American Potash & Chemical: phosphinoborine (phosphorous-boron compounds).

Ethyl Corp.: stannoliloxane (tin-silicon).

General Electric: "Versilubes" (silicones) for use above 450°F (575°-700°F); being studied for use on chemical bomber WS-110A.

WADC: tetra substituted alkylsilanes (now in the advance testing stage as a hydraulic fluid); fluoroalkylsilanes; ferrocene.

Beyond these, liquid metals are being suggested as ultratemperature lubes and hydraulic fluids.★

Market Analysis for the Missile Industry

an analytic approach to planning

by **Douglas S. Evered**

FOR EACH of the past six years United States defense expenditures have been between 35 and 43 billion dollars. This has made the Federal Government the largest single customer available to U.S. industry. During 1957 an economy-minded Congress and seemingly earnest disarmament talks made the future of this annual expenditure seem uncertain. Cutbacks, stretch-outs and layoffs became common as belts were tightened. The advent of the *Sputniks* and Soviet ICBM threats did much to dispell the belief that sudden death from precipitous disarmament was in store for defense industries. However, their presence did little to halt one trend in defense procurement—the shrinking market for military aircraft that has accompanied the swing towards missiles.

Competition in the Missile Industry

Automobile Companies	
Ford	Aeronutronic Systems—parent company allocated $10,000,000 for *Far Side* project
Chrysler	Production contract for *Redstone* and *Jupiter* missiles for U.S. Army
General Motors	Powerplant production for Martin *Matador* and Chance Vought *Regulus* missiles—AC Division—guidance equipment for *Thor* IRBM, *Matador* and *Regulus*
Studebaker-Packard Corp.	Aerophysics Development—*Dart* missile for U.S. Army—high-altitude sounding rockets
Rubber Companies	
Firestone	Prime contractor for *Corporal* missile for U.S. Army—missile development by J.P.L.
General Tire	Aerojet-General Corp.—rocket engines for Martin *Titan*—high-altitude research rockets
Goodyear	Goodyear Aircraft Co.—Akron—guidance for Martin *Matador* missile
Unclassified Competitors	
Kaiser Industries	Contracts for guidance systems development at Toledo—contracts for missile electronics at Richmond, Va.
Bendix Aviation	*Talos* prime contractor for U.S. Navy. Also *Talos* L for USAF
Minneapolis-Honeywell	Inertial guidance systems
Thompson Products	40% control of Ramo-Wooldridge Corp. (responsible for Convair *Atlas* and Martin *Titan* ICBMs and *Thor* IRBM)
American Machine & Foundry	Ground support equipment
American Bosch	Arma Co.—guidance systems
Avco	ICBM nose cone research
General Electric	*Vanguard* first stage—production of rocket motors and ICBM nose cone
General Mills	Inertial guidance systems

Electronic Companies with Missile Contracts

Sperry
RCA
Motorola
Western Electric
Philco-Raytheon

Aircraft Companies with Missile Departments

Beech
Bell
Boeing
Chance Vought
Convair
Douglas
Fairchild
Hughes
Lockheed
Martin
Northrop
North American
Republic
Ryan

Recent events undoubtedly mean that more money will be forthcoming for defense. Much of the money Congress is being asked for will go into missiles but it will have to be spent in what has become a highly competitive market.

Over the last few years a steady stream of competitors has been attracted by the missile bonanza. What was formerly the exclusive domain of the aircraft manufacturer is now inhabited by automobile companies building complete missile systems, food companies developing guidance equipment and tire companies manufacturing rocket engines. The result is a healthy competitive situation in the missile business. Putting the Departments of the Army, Navy and Air Force into a buyer's market for missiles is unquestionably good for the country. It means more defense per dollar of the taxpayer's money. It also means that realistic companies have had to seek ways to strengthen their techniques for getting their share of new missile business.

Next to maintaining a first-rate scientific and engineering capability, a specialized form of market analysis is the most useful device for bolstering the business-getting capability of a missile manufacturer. By providing management with reliable predictions of future missile markets, it can play a significant role in coping with the competitive situation which has developed. Take for example that important question of company-financed studies of new system requirements. No missile company can afford to study them all, and missile market analysis can ensure that funds set aside for this purpose are spent most wisely.

Generally speaking, new missile projects must represent a substantial advance over existing systems or meet some new operational requirement before they are funded. To achieve such advances means being aware of technological development and incorporating the findings of research into new designs. Indeed, many missile manufacturers spend sizeable amounts of their own money on the basic research which brings about technological advances. This directed effort can be pointed by missile-market analysis.

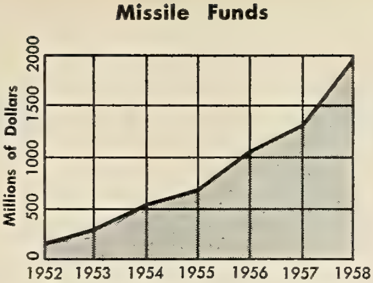
The diverse nature of the specialized activities which make up missile-market analysis explains why, in many missile companies, no formal market-analysis function is defined. Instead, the various studies made in a complete search for new business have their findings synthesized and used by departments with a wide variety of titles—Military Requirements Section, Long-Range Planning Section, Development Planning Section, Military Liaison Section, Military Contracts Section, Proposals Section, Customer Relations Section—to name some of the more familiar titles. In any one of these organizations, aspects of market analysis are likely to be going on in perhaps an unrecognized, or at least ill-defined, manner. Only where the possibilities of market analysis have been *recognized* and *defined* can the device function with the best results.

What then are the steps in effective market analysis for the missile business?

They begin with the close monitoring and evaluating of the technological developments being made by industry, universities and governmental scientific organizations such as the National Advisory Committee on Aeronautics. As already indicated, this step is often enhanced by basic research activity within the company. The application of technological development to future missile systems is the purpose of this type of analysis.

A second step consists of becoming aware of military planning through close association with those agencies which directly or indirectly determine future requirements. This is a liaison aspect of market analysis. Both in a formal and an informal manner, relationships must be established and strengthened with agencies such as ARDC, AMC, ABMA, TAC, SAC, ADC, WSEG, AFDAP, AFMLP, ONR, OSR, RAND and OEG.

The market analysis process also must include the study of pertinent economic factors. Federal fiscal policies, defense appropriations and the funding expectations of existing and planned systems must be projected and measured against the background of a general economic forecast. In this way the potential volume of future missile business and that share the company should expect to get can be determined.



Although the foreign political situation is cloudy much of the time, attention must be paid to this subject for the rather obvious reason that missile procurement is undoubtedly influenced by international tensions. Insincere smiles or bravado statements by Soviet leaders profoundly, though perhaps indirectly, affect the future of missile procurement. Insight into basic political motives and the immediate and eventual outcome of pursuing them must be obtained and injected into the analysis.

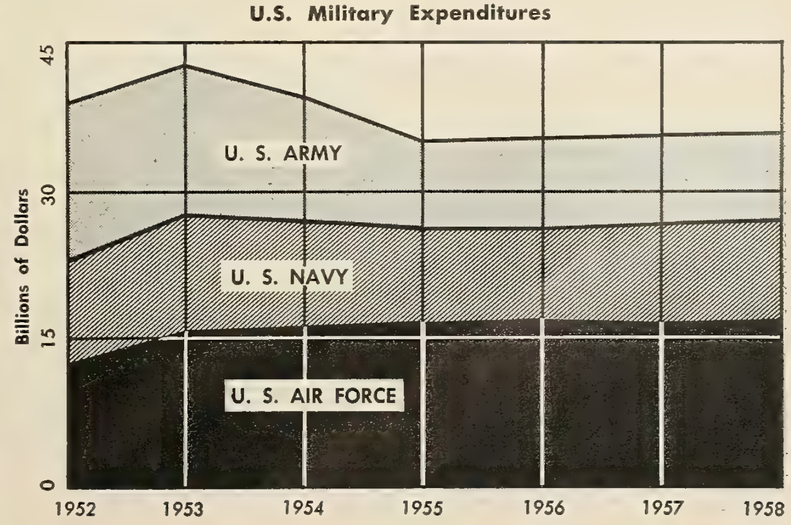
The desires, capabilities and limitations of the missile manufacturer to become associated with new projects must certainly be taken into account in market analysis for missile business, as must the equally important factor of the customer's view of the missile manufacturer's availability to take on new work.

Finally, the activities of competitors must be monitored to determine their effects on the likelihood of obtaining future contracts.

It must be obvious from this review of the ingredients of missile market analysis that a team approach has to be used. The team must include physical scientists to compile and evaluate technological developments, social scientists to investigate economic and political factors and military experts to interpret military planning. The team must be attached to the policy-making level of the company so that it will be both intimately aware of the basic philosophy of the enterprise and able to present its findings and recommendations to the policy-makers.

Equally obvious is the fact that not all companies will conduct missile market analysis in great depth. Some companies may lack the resources for basic research or may not see the wisdom of preparing themselves to take on advanced projects through obtaining a full understanding of the total missile market. Other companies attempt to achieve a sufficient degree of understanding by reliance on the work of their liaison staff. However, unless all of the influencing factors are taken into account, the results of missile market analysis are likely to be disappointing. When the additional usefulness of the market analysis team for exploring diversification opportunities is recognized and used, their presence in well-managed missile companies can readily be understood.

Comprehensive market analysis for the missile business begins with the collection of quantitative and qualitative data and proceeds through analysis and the application of seasoned value judgment to arrive at findings and recommendations for management. It is a process which does not displace the intuition which has largely shaped the growth of American competitive free enterprise.★



How Good Are Free Radicals?

laboratory device or new propulsion system?

by **Erik Bergaust**

RIGHT NOW, free radicals do not offer the hope of a practical, high-energy, high-density rocket propulsion system. They are becoming an important research tool in the laboratory but propulsion systems are a long way off. A big breakthrough has to be made in stabilization and, possibly, in production. Production techniques are just being discovered, while techniques for stabilizing these energetic chemical fragments are very few.

Rocket engineers have long looked to free radicals for performances of two to five times greater than conventional redox (reduction-oxidation) or combustion systems. However, laboratory preparative techniques have been slow in coming.

The famous German chemist, Justus von Liebig, offered the concept of the radical as a group of atoms that acted as a unit in a chemical reaction. Liebig and Wöhler worked on the benzoyl radical. (In 1828 Wöhler made the first lab synthesis of an organic compound.) In 1900, at the University of Michigan, Moses Gomberg prepared an organic free radical—triphenyl methyl—a giant fragment that can live for days. By 1929, Paneth and Hofeditz broke down tetramethyl lead into lead metal and free methyl radicals.

Free radicals are fragments of ordinary, stable chemical molecules (Fig. 1). These molecules can be "cracked" by applying energy—heat, electric discharges or radiation. Free radicals (unlike ions) are electrically neutral and are usually characterized by an odd number of electrons in the outer shell. Free hydrogen would have one electron, methyl nine, hydroxyl nine and chlorine 17.

Free oxygen, however, has two unpaired electrons—leading to extreme reactivity. The radical with an odd unpaired electron seeks a more stable level and also accounts for extreme

A. H_2 + Energy (92,910 Btu/lb) → 2H → H_2 + Energy (92,910 Btu/lb)
Breaking molecular hydrogen into free or atomic hydrogen required energy. This energy is released when the molecule is reformed. Without combustion this technique would allow tremendous concentration of energy for rockets.

B. H_2O (HOH) + Energy → H + OH (Hydroxyl)

C. CH_3OH + Energy → CH_3 (Methyl) + OH

D. O_2 + Energy → O + O

E. NH_3 + Energy → NH (imine) + H + H

Fig. 1—Examples of free radicals: A illustrates most energetic systems. Others are B, water; C, alcohol; D, oxygen; E, ammonia.

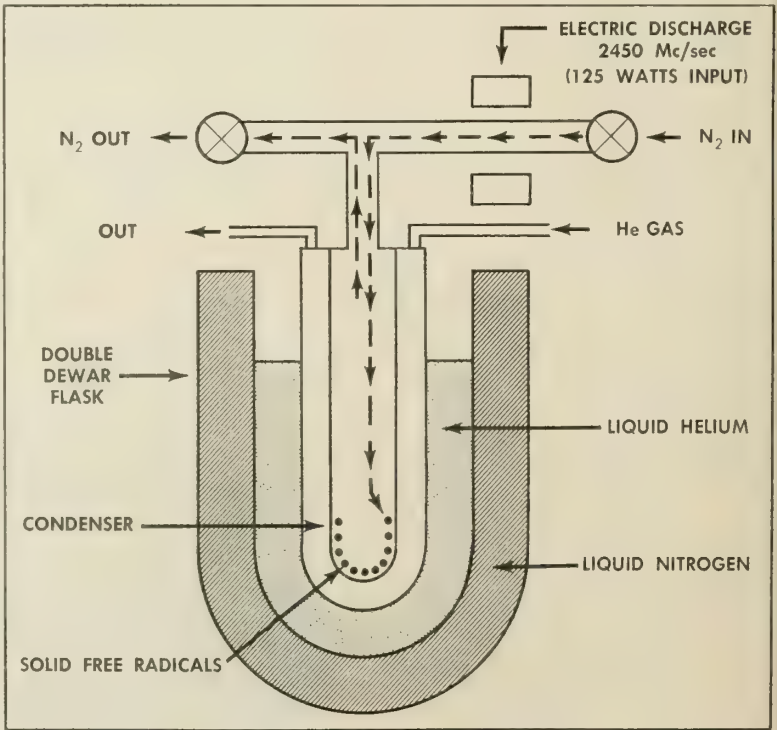


Fig. 2—NBS free radical technique. (Note: Liebig, advocate of the free radical, has also made the present lab prep possible. Condenser above is an adaption of the Liebig Condenser.)

reactivity. The energy residing in the free radical systems seeking the more stable parent molecule is very great (Table I) and is considerably greater than ordinary redox reactions.

Typical theoretical performances (based on recombination alone) are presented in Table II. After recombination into molecules, additional performance increases can be effected by the use of standard combustion techniques.

In 1948 at Catholic University, a free radical research technique, now standard, was accidentally discovered. There Francis Rice used heat to decompose hydrazoic acid (HN_3) into nitrogen and the imine (NH) radical. At liquid-nitrogen temperatures (77°K) or at approximately −320°F blue imine radicals were frozen out. Absolute zero (0°K) is −273°C (−459°F), or that temperature at which molecular motion ceases.

In 1954 Herbert Broida and John Pelham of the National Bureau of Standards sent an electric discharge through nitrogen gas and condensed out a solid at 4.2°K. Visible radiation from this solid has been interpreted as coming from atomic and molecular nitrogen. Fig. 2 shows the NBS Dewar collection system for free radicals.

The electric discharge breaks down the molecular nitrogen into atomic nitrogen. Free nitrogen is condensed as a solid at the bottom of the apparatus. With flow rates of 10 to 200cc/min, the solid glows green but turns yellow at the higher rates. Local warming causes brilliant blue flashes from the surface as the nitrogen goes back into its normal state and releases large amounts of energy. NBS has also prepared atomic oxygen and hydrogen.

From this early work, free-radical research projects have branched out to include the following:

National Bureau of Standards has underway a three-year program supported by the Department of Defense for the formation and stabilization of free radicals. The NBS project is unclassified and is a center for university and industry free-radical research. Several large firms have stationed scientists at NBS to aid research.

Table I:
System Energies

Fuel	System	Heat Content (Btu/lb)
Atomic hydrogen	Nonredox	92,910
Molecular hydrogen	Redox	52,000
Diborane	Redox	32,000
JP-4	Redox	18,000

Table II:
Free Radical Performances*

Radical (mol)	Diluent (mol)	Molecule	Specific Impulse (sec)
1 NH	2.8 H_2	NH_3	410
1 CH	5.0 H_2	CH_4	510
1 H	1.7 H_2	H_2	775
H	H	H_2	2160

*Nonredox systems

Table III:
Concentration Versus Performance*

Free Radical Concentration in Diluent (mol %)	Nonredox Specific Impulse (sec)		
	O in O_2	He* in He	H in H_2
5	60		200
10	100	300	400
20	140	360	580
40	190	500	800
60	225	625	950
80	250	730	1040
100	265	800	1210

*Frozen equilibrium as calculated by GE

Air Force Office of Scientific Research is sponsoring free-radical research.

Army Office of Ordnance Research is also sponsoring such research.

Applied Physics Laboratory is working on the stabilization of hydrogen atoms trapped in solid hydrogen at 4°K.

Aerojet-General Corp. has been working on a free-radical AFOSR project since 1954. The firm is aiming for production of ammonium azide via hydrazoic acid and the imine radical.

General Electric Co. Rocket Engine Section at Cincinnati has been calculating performance of free radicals for Army Ordnance.

Naval Radiological Defense Laboratory has undertaken irradiation of ethyl and methyl alcohol with high-intensity sources at liquid-nitrogen temperatures.

Office of Naval Research is also supporting free-radical research.

Other free-radical research work includes:

Atomic Energy Commission at Oak Ridge has irradiated frozen sulfuric acid with cobalt 60.

Caltech scientists are depositing molecules at 20°K and irradiating them to study possible new reactions.

Monsanto Chemical Co. has worked at NBS in blending gases to react with free radicals.

Olin Mathieson is studying the reaction of free radicals at NBS on various surfaces such as tungsten.

University of Lyon is working on the prism spectroscopy of free radicals at NBS.

Washington University suggests free radicals as an important energy step in the process of photosynthesis.

The USSR has been very active in the free-radical area. The Reds have reported production of atomic oxygen, nitrogen and hydrogen. Organic free radicals have been studied along with free-radical boron compounds.

The Soviets are especially interested in combining small amounts of free-radical fuels in conventional solvents, thus producing a two-step propulsion system. Considerable work has been evidenced in the OH and the HO_2

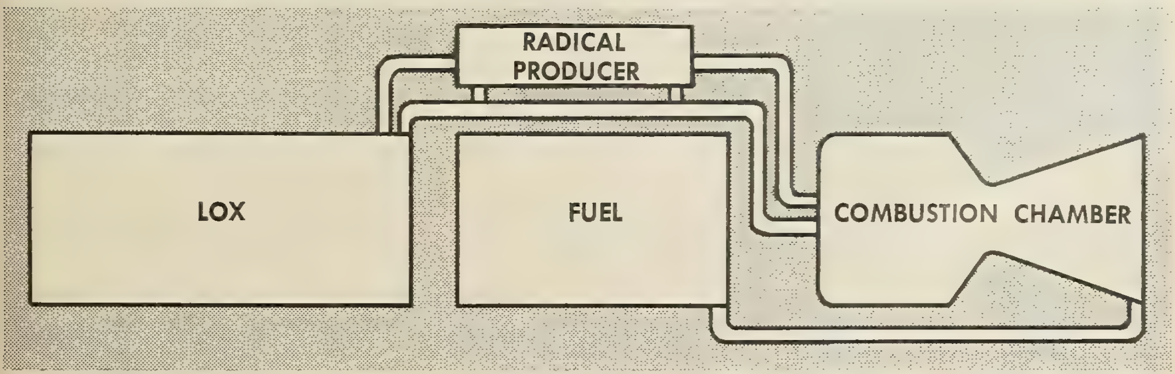

Fig. 3—Example of two-step propulsion system. Relatively small amounts of oxygen gas are fed into a jacketed free-radical producer. Atomic oxygen is fed into combustion chambers where conventional oxidant-fuel (redox) system is also operating. Such a system might offer immediate increases of about 50 seconds until more is learned about stabilizing high concentrations of free radicals.

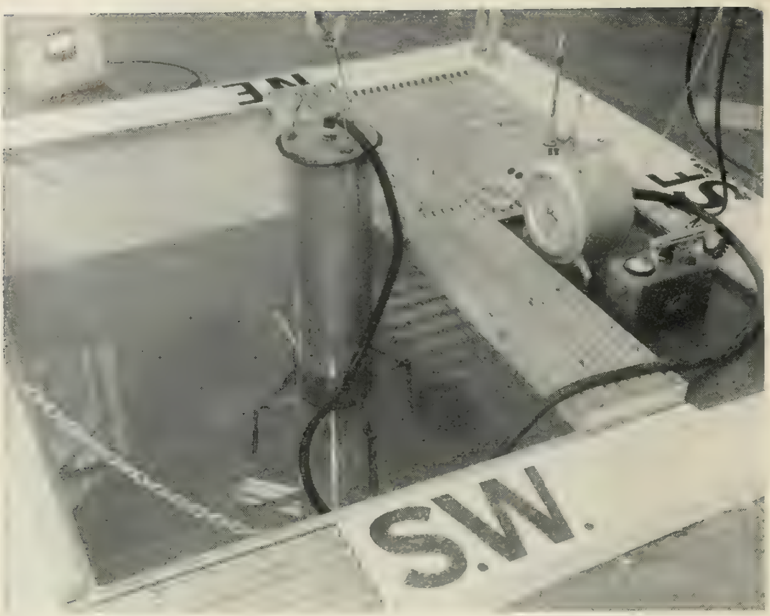

Fig. 4—Production of free radicals by gamma ray bombardment in a cobalt 60 source.

radical. Russian work with hydrogen superperoxide synthesis, possibly a polymer of the HO_2 radical, has been under way for several years. Several research teams in the free-radical scene have been in operation at least since 1950.

Almost all free-radical work employs cryogenics (ultralow temperatures) at low pressures. The theory is simple. At very low temperatures kinetic movement is very slow. If the pressure is kept down, the fragments do not bombard one another and hence lose energy.

This theory may make practical application difficult if not impossible. For example, a jump of a few degrees Kelvin for free radicals is like thousands of degrees for ordinary chemical systems. Warming a free radical from 4°K to 25°K is equivalent to a jump from room temperature to that of an acetylene flame. And performance drops with increasing radical size.

The large, stable fragments do not offer good performance as such (Table III). Hydrogen is better than helium or oxygen. However, after free radicals revert back to ordinary molecules and release energy, the recombined molecules are still available for further energy release via combustion reactions. Almost any conventional propellant system could be improved performance-wise by a free radical "spike" (Fig. 3).

In addition to the critical stability, concentration is also important. Present free-radical concentration estimates are about 0.1 per cent by electron spin resonance methods and up to one or 10 per cent by chemical or calorimetric methods. Thus, say, incorporation of about 1 per cent atomic oxygen in liquid oxygen might jack up rocket impulse by about 50 seconds.

Present lifetimes of free radicals leave much to be desired. At pressures of about 1 mm Hg, NBS figures a lifetime of about 15 seconds for free radicals. With decreasing temperature, the lifetime increases. GE figures that metastable neon has a half-life of about 25 seconds at 10°K, many years at 5°K.

Because of these facts and because of lack of sophistication in the field, Dr. Broida said recently that the odds do not now favor free radicals as practical, high-density, normal-temperature propellants. Perhaps this grim picture could change if better stabilization techniques were evolved. Such stabilization might result from new solvent systems, protective colloids, or occluded solids. It might even take the form of free radicals trapped in a solid propellant, as recently suggested by H. W. Ritchie of Thiokol. However, before we can use free radicals in a rocket we must learn much more about them. This takes years.★

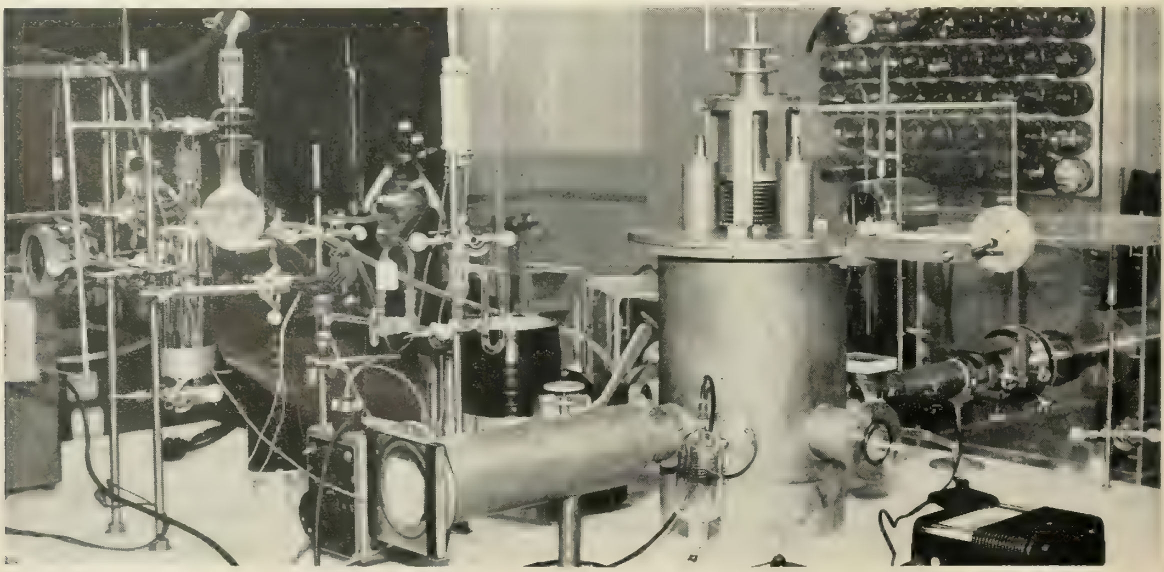

Fig. 5—Electron diffraction apparatus for studying and producing free radicals.

SELLING MISSILES

by Seabrook Hull

The scramble in the missile marketplace is getting louder and rougher. Everyone wants to get into the act. Some answers to "how to get in the missile business" involve some pretty extreme answers—even to the point of buying one's way in. However, one conclusion is general: the missile business is big already and getting bigger all the time. It's also a profitable one in more ways than one.

Some companies have been in the missile business from the beginning. Airframe-makers, for example, were some of the first, because it appeared at the time that they were a likely place from which to buy missiles. "After all, like airplanes, they fly too, don't they?" However, it was soon apparent that it wasn't all that simple, and others were brought in. Forging, machining, welding and heat-treating, for example, to a large extent took the place of casting, sheet-metalworking and riveting. Since then some of the "unlikeliest" kinds of companies have emerged playing a major role in the burgeoning industry. Now the pull of the swelling dollar sign is drawing them in by the hundreds. Competition gets tougher daily.

There are a few basic across-the-board rules for getting into the missile business. First, and most obviously, study the market. Find out what's wanted; who's already in the business; who is doing the subcontracting; who are the vendors; how much money is involved; and which agencies have it to spend.

Next, compare the requirements with your facilities, both human and capital. Have you the equipment for supplying any of the market's needs? These are elementary approaches to any business. They apply just as much to rockets and missiles as they do to anything else.

If you find your capabilities fit the market's needs, get out and sell. Sell! This again is just as vital in missiles as it is in, say, plastic combs, automobiles or ladies' underwear. And in selling, there's no real substitute for being on the spot in person.

If you're just starting out, you'll probably have better luck breaking into the business if you content yourself with first becoming a subcontractor or vendor. This means getting in touch with the purchasing officers and/or project managers of those companies with prime or large subcontracts. You can get a list of these from the Department of Defense.

In making this contact, remember that the man you're trying to sell is busy, may not be all that bright, talks to dozens of other people trying to sell precisely the same services or products that you offer. In other words, make your proposal clear, concise and to the point. Offer a specific product at a good price and with confident guarantees of top quality and on-time delivery. These points should be obvious, but the number of people who wander vaguely in with bland statements about "I've got so and so facilities. What can I do?" is appalling.

Now maybe, your capabilities don't exactly fit the missile market requirements. This doesn't necessarily mean you're out of luck. For example, most missile metals require a density not attainable in normal casting processes. But casting is a valuable mass-production technique. Thus, one possibility here—to start—is to get a research contract to determine (a) just where casting can and cannot be used and (b) develop more suitable casting methods.

In other words, if your processes seem in danger of being bypassed by the missile age, get the Government to pay you to find out how it can be kept in the industrial complex. However, be specific in your proposal and don't be too ambitious (greedy) on the first go-'round. Figure a program that will bring solid results quickly and inexpensively—and will provide a reason for a bigger, more costly program to follow.

Government contracts below, say, $25,000 can be approved by a division chief. As the sums get higher, the redtape they encounter mounts rapidly. It may not be much money, but it's a toe in the door and often a very good way to start.

Another technique that works is to bid on a job that you know you will lose money on—bid so low you know you're bound to get the contract. Perform well, and it will be a lot easier to sell the next time—at an equitable (profitable) price. This is really buying your way in.

Some companies are getting into the missile business by buying or merging with other companies that are already in the business. There's been a lot of this sort of thing lately. Still others get together in groupings where, between them, they offer a comprehensive ability. This is a device for those who already know the missile business but who want to improve their competitive position. A recent action involving both of these devices is the merger of Thiokol Chemical Corp. and Reaction Motors Inc., on the one hand, and Thiokol's agreement with Callery Chemical on the other. The merger gives Thiokol both solid- and liquid-rocket capabilities; the agreement gives both rockets high-energy boron fuels.

The business of studying the market carefully can't be overemphasized. So many peculiar problems plague missile development and production, there is no way of forecasting just where a better solution will come from.

For example, take solid-propellant rockets. There are two real posers which beg solution. Most solid-propellant grains (the actual charge) are bonded with a rubber-base material. Below certain temperatures, these get brittle and crack and instead of a rocket you get an explosion when you fire it. This means that solid rockets have to be heated when transported through cold climates. This is costly and a nuisance in the field.

One company, however, has come up with a rubber polymer that retains its characteristics (including flexibility) down to −120°F. This could be a valuable answer to a tough, costly problem. It could also mean profits to the developing company. First step, get a contract from the Government to see how it works as a binder.

These are just two examples of what researching the market can bring up. There are thousands of such problems plaguing the missile industry. Helping to solve them is one way to break into the business. But again, be specific in stating exactly what it is you propose to do and how you plan to set about doing it. There's a place for you in missiles, if you just go after it the right way.★

SPUTNIK NOT SO SECRET

by Dr. Victor P. Petrov

The first Soviet Sputnik *surprised us on October 4, 1957, when it was successfully launched by Soviet scientists and went into orbit around the earth. In addition to the initial surprise of the launching of this satellite, we were shocked to learn that they had managed to put into orbit a vehicle more than eight times heavier than the one we expect to launch in March. Then, another surprise—the launching of the second* Sputnik *on November 3, 1957, weighing (according to Soviet sources) more than a half ton and containing a live dog, as Soviet Academician Sedov had predicted (m/r, Nov. 1957). This time the satellite weighed almost 50 times as much as ours, which was still on the ground.*

We know very well that the Soviets are secretive, and the officials of the International Geophysical Year program probably were peeved at the Soviets' inability to supply the organization with particulars on the scientific instruments aboard *Sputnik* I. American Minitrack stations had to make hurried changes *post factum,* after *Sputnik* I was already in its orbit. However, knowing this tendency of the Soviets, we should have been more alert. A diligent and painstaking study of Soviet periodicals, and especially technical and scientific magazines, could have given us some valuable information.

For example, we were indignant at the Soviet scientists' failure to inform us beforehand of the frequencies on which the radio transmitters of *Sputnik* I were to send their messages back to earth. However, even with all this secrecy, we could still have learned about their plans to use frequencies of about 20 and 40 megacycles. The June 1957 issue of the magazine RADIO, published for the benefit of Soviet radio amateurs, specifically mentioned that the first earth satellite would have two radio sets operating on these frequencies with about one watt strength. Furthermore, four months before the launching we could have learned that the radio messages from the satellite were to be of 0.05- to 0.7-second duration and spaced in such a way that the messages on one wave length would emanate during the pauses on the other.

This same article also explained that changes in the physical conditions during flight would cause a consequent change in the form of the transmitted radio signals, but that these changes would be discernible even to amateur radio operators. To assist the amateurs in recognizing the possible forms of transmission and changes in them, a chart was provided. This chart, resembling an oscilloscope image of the signal, would have been of great help to our scientists if available to them at the time. The article even alerted the amateurs to watch for the radio signals transmitted by the satellite.

Another article in the same issue of the magazine impressed on the radio listeners the importance of recording the *Sputnik* signals on a magnetic tape and synchronizing it with the exact time. The length of dots and pauses thus registered would give valuable information about certain processes on the *Sputnik* itself.

Sputnik II, of course is more interesting, if only for the fact that it is of greater dimensions and weight and carried a live dog. The greater space within this satellite allowed for more instrumentation. It should be noted that the dog was not sealed in the satellite without preliminary and extensive experimentation. We had, of course, known that the Soviet scientists were experimenting with dogs in rockets but information was fragmentary. In June, 1957, detailed information on these experiments could have been obtained from the annals of the Soviet Academy of Sciences. The Soviet rocket specialist Academician Blagonravov stated in an article that experiments had been conducted with animals since 1951.

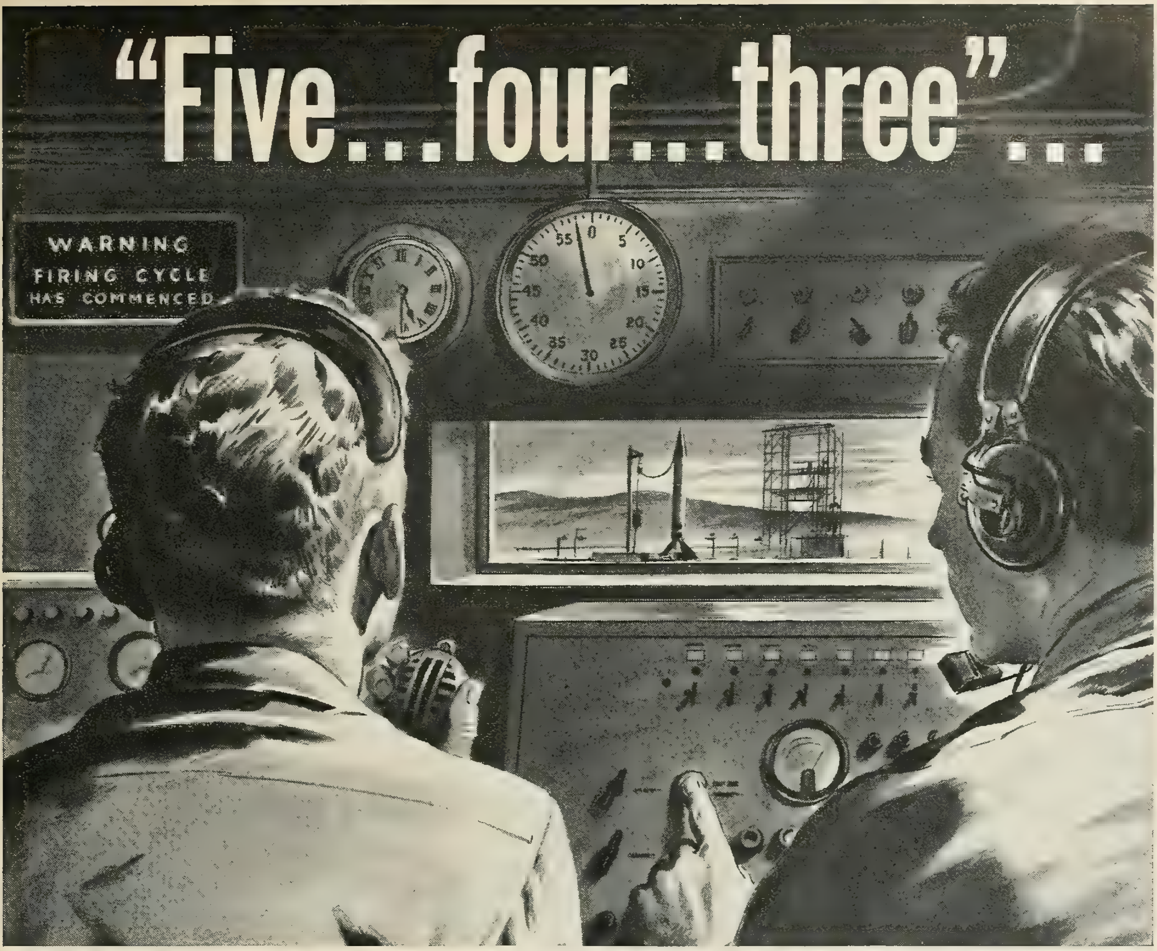
Originally, rockets were sent up to a height of 62 miles at a speed of 3850 feet per second. At the top of its trajectory, the cabin with the animals was detached from the rocket and was in free fall until it reached an altitude of two to two-and-one-half miles. Then its parachute system automatically came into action.

In later experiments, the animals were placed in sections of rockets which were not hermetically sealed. Special helmets, through which they received oxygen, were placed on their heads. They were then harnessed to special "carriages" which had all the necessary apparatus as well as parachutes. A supply of 550 cubic inches was provided—enough for two hours. At the top of its trajectory—a height of 60 to 70 miles—the rocket separated from the nose section containing the animals. The nose section then was in free fall to a height of about 55 miles, at which altitude a carriage containing one dog was catapulted from the section at a speed of 2300 feet per second. Three minutes later, the parachute opened. The second dog remained in the falling rocket nose until it reached an altitude of 25 to 30 miles, where the carriage was catapulted at a speed of 360 feet per second, and continued in free fall to a height of two-and-one-half miles, when its parachute opened.

The movies taken automatically during the entire experiment indicate that the animals were very calm during the flight, and only a few of them were disturbed at times of excessive vibration. In several cases the dogs just slept. No significant changes in the behavior or basic functions of the animals or their systems were observed.

Even before their first *Sputnik* was in orbit, Soviet scientists freely discussed the possibilities of observation of plants and animals aboard future *Sputniks*. The fact that the first *Sputnik* would be heavier than the *Vanguard* satellite was indicated in IZVESTIA two weeks before the *Sputnik* was launched. It was also divulged a year ago that experiments with various animals—mice, rabbits and monkeys—would be conducted in three-stage rockets. While the monkeys were in the upper atmosphere, scientists continuously observed their pulse, blood pressure in arteries and veins and made electrocardiographs. These observations, it was claimed, would be very "important for setting up future interplanetary flights with the participation of men." ★

Dr. Petrov, who has authored articles in England and Germany, is a professor in the U.S. Naval Postgraduate System.



Two seconds to "FIRE"...the time when your instrumentation cables must work

Are you responsible for any of the equipment involved in scenes of this kind? Any of the instrumentation or telemetering devices?

If so, you well know how little can be left to chance when a $100,000-plus pre-dawn "shot" is scheduled.

Even minor cable trouble at a time like this can be crucial and costly, especially if it happens on the equipment involved for which *you* are responsible.

That's why it's important for you to insist on electronic cables with *maximum built-in reliability.*

Quiz yourself on cable

Here's how to get this kind of reliability. Ask yourself these questions about the cable that's to go into your own equipment:

1. Who is the cable supplier? Has he:
   a. Thorough knowledge of electronic wiring problems?
   b. Engineering and research skill in developing special cable?
   c. Complete facilities for producing custom-built or specification cable?
2. Are his cable conductors full-size, uniformly annealed and precisely stranded?
3. Are his insulations and coverings uniformly applied compounds that have proved workable, dependable?
4. Can he supply those newly developed materials that might be needed?

You'll find all of these qualifications met in full measure by Rome Cable

Millions of feet of Rome wire and cable have already been installed in electronic gear for military and commercial uses. More is ordered every day.

When you require cable that must not fail—or which must meet unusual specifications—we can very probably help you. Simply contact your nearest Rome Cable representative—or write to Department 422, Rome Cable Corporation, Rome, N. Y.

in the new
SANBORN "450" SERIES

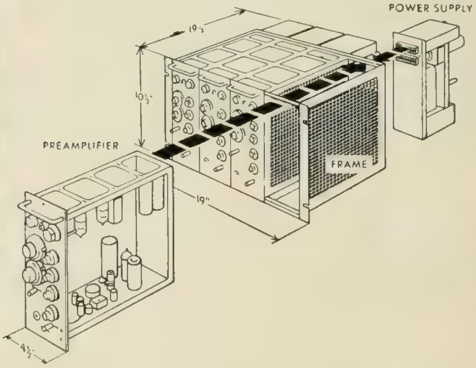
Model 450 1200 Servo Monitor
(Demodulator) Preamplifier

Model 450-1300A
DC Coupling Preamplifier

Here are the newest of the recently introduced Sanborn "450" Series Unit Preamplifiers—compact, lightweight, self-contained instruments for use with optical and tape recorders, wide band 'scopes, panel meters, computers, etc. (For use with high speed optical galvanometers at frequencies above 500 cps, requiring larger current swings, a transistor output amplifier is built into the 450-1800A True Differential DC type and available as optional equipment on other 450's.) As with all 450 Unit Preamplifiers, the new Servo Monitor and DC Coupling models mount in either individual portable cases or in the four-unit 19" module frame (#354-1100-C2) shown. The *450* designation refers to *unit packaging* of Sanborn 350 Preamplifiers and Power Supplies in individual 450 cases. Loosening two front panel thumbscrews allows quick, simple interchangeability. Since *all* "450" Preamps use the 350-500 Power Supply (which remains in place at the rear of the frame or case), new requirements necessitate only additional *Preamplifier* units, permitting sizable savings in equipment investment.

The Model 450-1200 is a phase-sensitive demodulator, whose DC output voltage is proportional to the in-phase (or 180° out-of-phase) component of an AC signal with respect to a reference. Precision measurement is realized by such characteristics as negligible quadrature signal error, provision for floating signal and reference inputs, front panel VTVM for accurate calibration signals. The 450-1200 accepts the outputs of resolvers, synchros, differential transformers and other transducers. The 450-1300A is a moderate gain, balanced input—balanced output DC amplifier. Its input circuit performs equally well with single-ended or balanced signals.

The "450" Series Unit Preamplifiers presently include the Model 450-1100 Carrier, 450-1200 Servo Monitor, 450-1300A DC Coupling and 450-1800A True Differential DC types. Following these will be "450" Series Logarithmic and Low Level types. Further data and application information on present models is available on request.



MAJOR SPECIFICATIONS

MODEL 450-1200 **SERVO MONITOR** PREAMPLIFIER

Sensitivity: 5 mv (in phase) produces 1 volt at output jack under maximum output load conditions
Input Impedance: Signal 100k
Reference 12.5k for 15 volts, 55k for 120 volts
Frequency Response: 3db down at 20% of carrier frequency filter position
Carrier Frequency Filter: Selected by a switch (three positions)
Low 60 cycles
Med 400 cycles
Hi 1000 cycles (5000 cycles optional)
Reference Voltage: Internal selection accepts voltages from 15 to 120 volts
Quadrature Rejection: Ratio better than 100:1
Maximum permissible quadrature before overload indicator lights is twice full scale (in phase)
Calibrate Voltage: 10 millivolts internal (set by meter on panel)
Drift: Less than 0.1% of full scale per hour
Preamplifier Output Jack: ±3 volts available into 2.2k minimum load resistance. Output appears across two cathodes at approximately ground potential
Rear inputs and **overload indicator lights** are included
Output Impedance: 1k
Overall Linearity: ±¼%
Power Requirements: 115 volts, 50-400 cycles, approximately 35 watts

See the new "450's" and other Sanborn equipment at
Booth 3601-3603 I. R. E. Show

MODEL 450-1300A **DC COUPLING** PREAMPLIFIER

Sensitivity: 50 mv produces 1 volt at output jack under maximum output load conditions

Input Impedance: 5 megohms each input side to ground

Input: Single-ended or push-pull

Preamplifier Output Jack: ±3 volts into 2.2k minimum load resistance. Output is balanced and appears across 2 cathodes at approx. ground potential

Output Impedance: 1k

Drift: Referred to input 2 mv/hr. line voltages change less than 10%

Frequency Response: 0-20kc

Calibration: 100 millivolts internal

Linearity: ±¼%

Rear inputs included

aluminum: For Missiles in Production

by Don Fabun

SO MUCH has been published about the use of rare or lesser known materials in missile design that the fact often is overlooked that the "workhorse metal of the air age"—aluminum—is playing an integral part in missile programs from *Atlas* to *Zuni.*

Several months ago, a comprehensive survey was undertaken in Kaiser Aluminum & Chemical Corp. to determine just where and how aluminum is being used in current missile programs and what its future market potential might be.

In some cases, security restrictions on missile details made the search difficult; many of the prime contractors were already in the aircraft business and already buying aluminum, so that there was no easy way to tell whether the metal was going into aircraft or into missiles; and, finally, the entire missile industry is so complicated that tracing the progress of a single order of metal through the network of contractors and subcontractors was often impossible.

Nevertheless, from the information gathered so far, some interesting points can be developed:

Aluminum is being used in significant quantities or in critical areas in more than half of all the missiles that have reached the production stage today. The percentage would undoubtedly be higher if information was available on all missiles.

A composite rocket that would be reasonably complete could be built from parts of rockets now being made of aluminum. Such a composite would include aluminum airframe, skin, wings, wing spars, nose cone, tail, fins, brackets, wiring systems, fuel tanks, motor heads, rocket motor tubes, solid-propellant core molds and electronic components in the guidance system.

Substantial quantities of aluminum also are being used in the ground fueling apparatus for liquid fuel rockets (as for the external skin for *Thor* LOX storage tanks), in missile weapon carriers, launching ramps and launchers, ground guidance systems, tracking and control systems, reusable containers for shipment and storage, and in attachment pads and devices for all types of airborne missiles.

Just about every major form in which aluminum is available is used in the missile programs: sheet, plate, castings, extrusions, forgings, rod, bar and wire, electrical conductors, insulated wire and foil.

There are good reasons for this across-the-board aluminum usage: lightweight (one-third that of the same volume of steel); versatility; some 26,000 firms with the know-how and equipment to work with aluminum; low maintenance factor; and, finally, its economy as a structural metal.

These considerations have led to the so-far-revealed uses of aluminum in current production or operational missiles shown in the accompanying table. The figures in the table were secured through direct contact with the public information officers of each of the appropriate services, or by direct inquiry to the prime or airframe contractors.

There is additional usage of aluminum in most of the missiles which have built-in guidance systems, but the weight for any specific unit would not materially affect the total aluminum in each missile.

Knowledge of this market's potential is of particular interest to the aluminum industry at the present time because it has been engaged for the last several years in a major expansion of primary aluminum producing facilities. One reason for the aluminum industry's expansion, to begin with, was to create such aluminum producing capacity throughout the nation that there would be enough aluminum to satisfy the needs of even the very largest potential users (automobiles, building trades, cans, etc.) without jeopardizing a reserve capacity for meeting military requirements.

When and if missiles move into

Known Uses of Aluminum in Current Production Missile Programs

Missile	Gross Firing Weight Per Unit	% or Pounds of Aluminum Per Unit
Corporal	12,000 lbs.	4,000 lbs.
Dart	100 lbs.	5%
Falcon	110 lbs.	11 lbs.
Hawk	1,200 lbs.	120 lbs.
Honest John	6,000 lbs.	960 lbs.
Jupiter	100,000 lbs.	17,500 lbs.
Lacrosse	500 lbs.	50 to 50%
Matador	13,800 lbs.	3,200 lbs.
Mighty Mouse	19 lbs.	2 lbs.
Nike-Ajax	20,000 lbs.	2,000 lbs.
Nike-Hercules	20,000 lbs.	2,000 lbs.
Rascal	13,000 lbs.	3,200 lbs.
Redstone	40,000 lbs.	4,500 lbs.
Sergeant	22,000 lbs.	1,320 lbs.
Snark	36,000 lbs.	1,300 lbs.
Sparrow I	300 lbs.	95 lbs.
Sparrow III	350 lbs.	280 lbs.
Talos	3,000 lbs.	500 lbs.
Titan	200,000 lbs.	(skin, hull—wt. not available)
Zuni	107 lbs.	(rocket tubes—wt. not available)

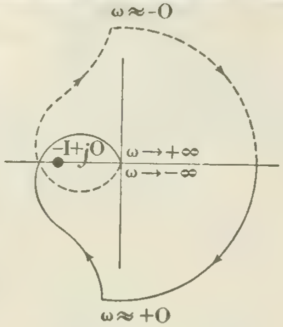
An Engineer Speaks Out...



...about a Fast, Reliable Way to Plot *Nyquists!*

Only one instrument, the Servoscope® Servosystem Analyzer, provides all the necessary data to plot a Nyquist diagram for *any* servosystem or component. Either sine, square, or modulated carrier wave signal is available as the input to your system. Each of the selected frequencies is fed in turn into the system. By turning the calibrated phase dial for a null pattern, the resulting quantitative changes are read directly. Signal amplitude (voltage gain ratio) is read directly from the associated indicator. The Nyquist diagram is completed by plotting phase and gain for each of the selected frequencies.

Servoscope is the *only* single instrument that:

- Covers the frequency range from 0.001 to 100 cps through choice of 5 standard models.
- Evaluates both AC carrier and DC servosystem.
- Provides all the following signals — sine wave, modulated carrier wave, and square wave phaseable with respect to either electronic linear sweep or sinusoidally modulated reference signal.
- Has a frequency calibration accuracy of ±2%; phase measurement accuracy of ±1°.
- Accepts any carrier frequency from 50 to 2000 cps.
- Requires no calibration.
- Indicates by means of associated oscilloscope, oscillograph, phase meter, or frequency meter.

the mass-production "hardware" stage, there will be ample capacity to meet all the normal peacetime aluminum requirements without an allocation program for nonmilitary users of aluminum.

Just how big a market for aluminum will missiles be? Obviously, the exact number of missiles being produced or about to be produced is kept secret, but it is possible to make some sort of a guess in some directions. When the guesses are put together, they indicate that the missile field may well be a large user of aluminum within the next few years.

Something like two pounds of aluminum are consumed every time a *Mighty Mouse* missile is fired. Armament on a fighter-attack plane is 104 rockets (although as many as 196 have been carried by a fighter craft). A full load of 104 rockets can be fired in ripple salvos, electronically, in three seconds. A group of 100 fully armed fighter craft firing continuously, assuming such a feat were possible, would use up one million pounds of aluminum in two and a half minutes.

Such a mass firing is unlikely, but the figures do make an important point. It is highly improbable that the big IRBMs and ICBMs, considering the nature of their payload and mission, will ever be used except in an allout global war. The number of units produced will be relatively limited, and their high per-unit cost will keep the number of test and training firings to a minimum.

The smaller missiles, which more and more are replacing conventional artillery, both on land and sea, are likely to be used up at a brisk rate in training maneuvers and limited-scale actions. The use of aluminum in these missiles is therefore of particular interest to the aluminum industry as a potentially large tonnage market.

How much? There is good backing for coming up with a figure of something like eight million pounds of aluminum in the *Nike-Ajax/Nike-Hercules* programs alone. Just how many of these have been built is classified, but in June 1957, the Army asked the House Appropriation Subcommittee for funds to rebuild 4000 *Nike* missiles in 1958. Since the money was for reconditioning 4000, it must be assumed that 4000 already existed, and, as pointed out in the table of aluminum usage, there are 2000 pounds of aluminum used in each *Nike* booster assembly.

Getting back to the *Mighty Mouse*, in October 1957, a West Coast contractor received a contract for the components for two million of these rockets. At the two pound per-unit rate, that's four million pounds of aluminum in the *Mighty Mouse* program alone.

Matador uses 3200 pounds of aluminum per unit. Although the figure has never been officially confirmed, a newspaper in October 1957, reported that 1000 *Matador*s had been built by that date. There's another 3.2 million pounds.

Adding together just the interpolated figures from these three programs —*Mighty Mouse, Matador* and *Nike-Ajax*—there's a total of 15 million pounds of aluminum accounted for, a figure of considerable interest to the aluminum industry, considering that the missile programs may be said to be just entering the mass-production hardware stage.

Even so, considering the metal's natural advantages for missile construction, it may seem surprising that more aluminum is not being used in missile programming. There are a number of pertinent factors here. For one, until quite recently, missiles have not been a mass production business, where aluminum's low cost and easy workability would recommend its use. In prototype stages, a missile is practically hand-crafted and the time and labor involved far outshadow materials cost. Missile designers have been absorbed in solving problems any way they could, and the materials they chose have not necessarily been picked for economy.

As a missile moves into full-scale production, time and labor drop, relatively, and the proportion of materials cost to the overall cost goes up. Unit figures on production missiles give some idea of what is involved. *Nike* I is said to have cost $20,000 per unit; *Sparrow* III is said to cost about $40,000; the *Falcon* costs $9000 to $10,000; the *Terrier* about $40,000 each; *Bull Pup* $10,000 and *Redstone,* $1 million per unit.

If the United States is to have these relatively short range, artillery-replacing missiles in quantities sufficient for adequate defense, price per unit is going to be an increasingly important factor. Aluminum's low basic price, easy machinability and light weight will recommend its use wherever possible to cut unit costs.

Perhaps another reason aluminum has not appeared to play the role in missile construction for which its characteristics fit it, is the "heat barrier" controversy, which has served to create in the minds of some designers and engineers a mental barrier against aluminum "because it can't stand the heat."

The basic premise here is that aluminum begins to suffer measurable loss of strength above 400°F. Since the surface heat of a missile during prolonged periods of exposure to air friction may rise to several times that figure, the argument goes, some better high-temperature metals (like titanium, molybdenum, zirconium, thorium, etc.) are needed.

Valid as the original premise may be, the argument overlooks two significant points. The first is that the practical limit for structural use of any metal is of the order of 2000°F. Since, at very high Mach numbers in the atmosphere, the surface temperature of missiles will exceed that, finding new materials is not going to be the answer. Instead, the heat barrier may be bypassed through redesigning flight paths and through skin-cooling devices.

A few weeks ago, a missile engineer at a major missile contractor's said, unequivocally, "Aluminum is back in the picture (for missiles). Since we can't solve the heat problem just by substituting high-cost materials, we're going to have to go back to aluminum and solve it with new designs and flight paths."

Since the greatest problem occurs during the period of traversing the dense atmosphere during blastoffs, some suggestions have been made for firing missiles at an altitude where air friction is not a problem.

Another consideration in the "heat barrier" argument is the length of time of exposure to elevated temperatures. Artillery-type missiles attain top speeds of Mach 2.5 to 5.0, at critical portions of the flight path. At these portions, friction of the atmosphere will develop high skin temperatures. However, the time of sustained high skin temperature is very short.

At Mach 3, for a missile intercepting at a 30- to 50-mile range, the actual exposure to high temperature is a matter of only several seconds, and most of this in the nose area. For high trajectory ICBMs or IRBMs, the time of sustained high temperatures is limited to the few seconds it takes for the missile to leave the atmosphere. Skin friction is not too critical at very high altitudes, in the rarified air found there. The short time (up to 60 seconds) of high temperature may not be as detrimental to aluminum as the standard physical test data developed for aircraft may indicate.

The aluminum industry is now working to develop complete information on the effects of high temperatures for short periods on aluminum.

All these factors: aluminum's already important role in missile design, its low cost, wide availability, workability, and the promise of even improved qualities to come through research, argue for a greater part for aluminum in missile development as the programs shift into high gear.★

THE
ELEMENT
OF
FREEDOM

and the System-Oriented Engineer

Freedom is doing what you like. Some system-oriented engineers like best to match their wits and skills against difficult problems. This characteristic or (idiosyncrasy) of liking complicated technical problems is one of the chief qualifications of the engineer we need. He will be required to study the multitude of interactions possible among advanced aircraft, missiles, and electronic devices with each other and with human elements in the nation's most extensive man-machine-computer system.

To qualify, substantial experience with air-to-air or ground-to-air missiles systems is required together with demonstrated aptitude in the field of system planning. Write for more information or call collect. Address: R. W. Frost, System Development Corporation, 2414 Colorado Ave., Santa Monica, California, EXbrook 3-9411.

Sandwich Rolling for Wide Steel Sheets

US Steel uses new method to fabricate thin-gauge metal

THE US STEEL CORP. recently announced that a major breakthrough in metal fabrication has been attained at its Homestead Works.

Experimental "sandwiches" of stainless-steel plates inside and carbon-steel plates outside are sealed by machine welding to hold the plates together. A special separating compound is applied to each of the plates before assembly to prevent fusing during the rolling process.

At the outset, the "sandwich" is three inches thick, but is reduced to about 10 per cent of its original width after being hot-rolled. After rolling, the ends and sides of the "sandwich" are sheared off and the carbon-steel covers removed to free the wide sheets inside.

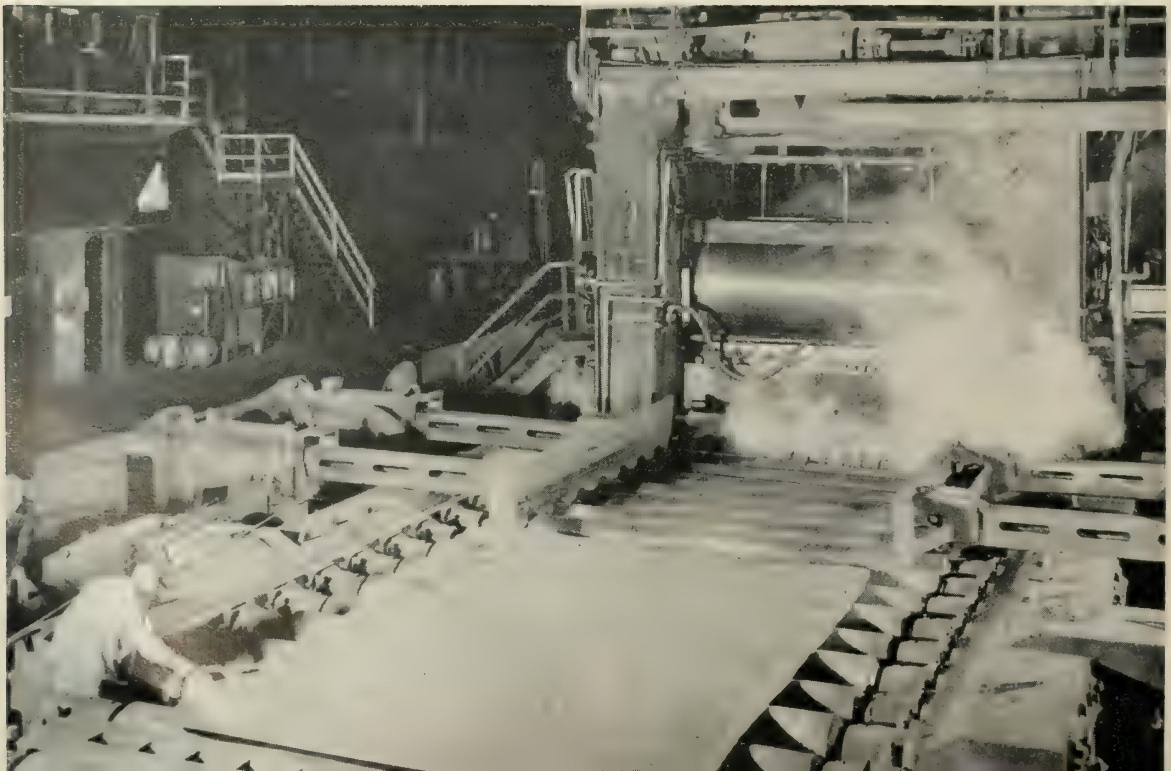
This new technique was developed under a research and development program designed to find means of producing wide thin-gauge stainless- and alloy-steel sheets for missiles.

Experimental runs with this technique have produced sheets 90 inches wide and 230 inches long—about twice as wide as sheets produced by ordinary production methods.

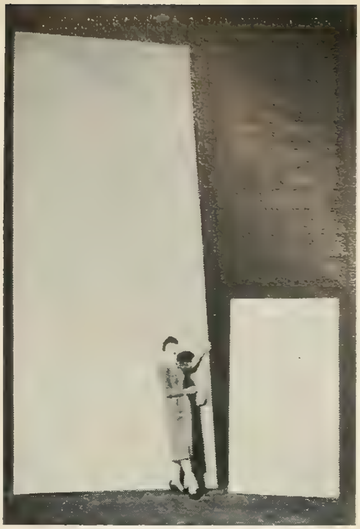
The real key to the process is the carbon-steel covers which insulate the stainless and alloy plates they enclose and keep the material at favorable rolling temperatures. This has allowed US Steel to produce the wide sheets on existing mill equipment.

This new process holds promise of better mill-produced materials for planes and missiles. Further studies to produce even wider and longer sheets of quality equal to the present ones are currently in progress.

Below—After heating and rolling, the "sandwich" resembles an ordinary mill product as its thickness is measured by a workman.



Near right—Fully assembled group of carbon-steel and stainless-steel plates are tack-welded prior to machine welding, which will seal all four sides. Far right—Comparison of conventional-rolled, 48-inch heet and sheet being produced by experimental process at US Steel. Larger sheet s 90 inches wide and 230 inches long, nearly double the width of regular sheet. Below—Workmen at Homestead District Works lower carbon-steel cover plate onto "sandwich" filled with stainless-steel plates. Hot-rolling will reduce thickness to 10 per cent of original. Several groups of plates have been rolled during this research and development program.



Above—Workman at Homestead Works coating stainless-steel plate with a special separating compound during the assembly of carbon-steel and stainless-steel "sandwich." Use of this compound prevents fusing of the metal plates during the hot-rolling process. After rolling, ends and sides of the carbon plates are sheared away; the resulting stainless plates are the widest ever produced on existing mill equipment. Left—Inspector examines finished stainless sheets after rolling.

ENGINEERING REPORT

A Case History of Environmental Control

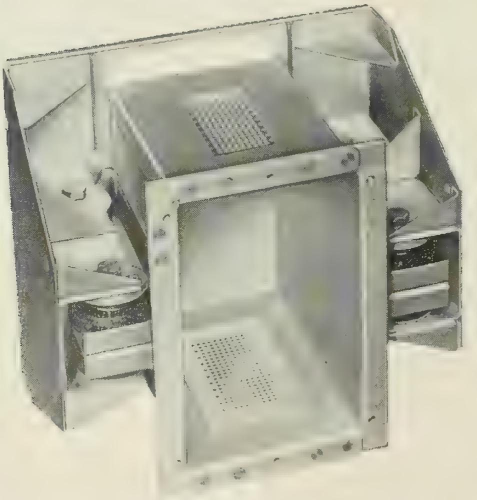
PROBLEM

VIBRATION • SHOCK AND COOLING

GUIDED MISSILE RELIABILITY

PROTECTION OF FUEL CONTROL EQUIPMENT from destructive vibration and shock in high temperature propulsion section of IRBM missiles.

SOLUTION



MODEL 1322 FOR REDSTONE AND JUPITER MISSILES

developed and produced in quantity for Redstone Arsenal and Chrysler Corporation.

ENGINEERED MOUNTING SYSTEM

MODEL 1322:

Robinson Model 1322 is a center-of-gravity all-metal mounting. Providing consistent performance regardless of high or low temperature extremes, this design incorporates highly damped Met-L-Flex resilient elements. All-attitude, multi-directional protection is assured.

SPECIAL FEATURES:

1. Ventilation screens at top and bottom of mounting enclosure allow the flow of cooling air, thereby extending the range of environmental protection.

2. Versatile mounting design facilitates adaptation to a wide range of components of varying dimensions.

PERFORMANCE:

Model 1322 protects against the rugged environment in the propulsion section of large rocket-type missiles. **Vibration, shock and acceleration forces** are controlled by the mounting system through a careful combination of spring rate and damping design characteristics. Natural frequency of model shown is 16 c.p.s. for an impressed excursion of .060 ins. and equipment weight of 8 lbs.

RESULT:

Adequate protection provided and reliability accomplished for vital elements of fuel control equipment through a light-weight standardized mounting system design. (Approximately six (6) systems installed in each Jupiter missile.)

Materials Build a New Technology

by W. C. Rous, Jr.

IN THINKING about earth satellites or even hypersonic rocket gliders, structural and materials people are concerned, among other things, with operational stress and temperature histories in relation to design requirements. Of necessity, this kind of thinking is based on many assumptions which vary with personal opinions.

Beginning with takeoff, rocket-thrust variations are programmed for considerations of flight mechanics and structural strength. Variations in stress occur during the boost phase, depending on the number of rocket stages being fired in parallel and in sequence. Generally, the stress on a rocket-propelled vehicle varies most rapidly and is greatest during boost. In heat content, however, the maximum temperature is usually encountered during reentry into a planet's atmosphere.

A number of magazine articles have been published indicating typical temperature which might be encountered. For example, during the first boost stage, the skin temperature about one foot from the leading edge might reach a temperature of the order of 500°F. After all the rockets have been fired, the temperature may rise to about 1000°F. Depending on configuration, the temperature may then rise to about 1500°F magnitude sometime after burnout.

Critical design criteria include the relationship between skin temperature, amount of required cooling, and structural weight as indicated; relationship of time with nose equilibrium skin temperature; temperature of an insulated skin, a heat skin and a transpiration cooled skin. Equilibrium temperatures could be of the order of 2000° to 3500°F at leading edges.

Structural weight and cooling load compromises are possible with a radiation-cooled, or a high-skin-temperature structure. If the structure is highly conductive, the heat transfer to the interior will be high, but the skin temperature will be low, resulting in a low structure weight and a high internal cooling load.

As the structure is made more insulating, the heat transfer through the structure into the interior will decrease, and so will the cooling load. However, the skin temperature will increase, requiring heavier structure. An optimum skin temperature is sought where the combined structural weight plus the internal cooling system weight will be a minimum.

An optimum balance must be attained between the structural and coolant weight, and the rate of coolant flow for a transpiration-cooled structure. At low coolant flow rates, the structural weight will be high and the coolant weight itself will be low. As the flow rate is increased, the structural weight decreases because the skin temperature will be lower as the coolant weight increases.

These environments constitute the problem. For primary structural materials, Figs. 1 and 2 present evaluation of possible materials as published in recent literature.

In Fig. 1, titanium and carbon steel will probably not be used extensively as construction materials. Stainless 347 is recommended by handlers of fluorine,

---

a new 4PDT relay to meet all requirements of MIL-R-25018!

Don't compromise with the Class C, Type II, Grade 3 requirements of MS 24114-9, MIL-R-25018. You don't have to any more. Now Union Switch & Signal has a 4PDT, rotary-armature relay designed to meet these specifications *completely*. It is the first of its type to do so. In fact, it *exceeds* some of the rugged requirements.

Here is the kind of performance you can expect from this new relay:

High operating temperature. Even at an ambient temperature of 200° C, this relay gives optimum performance. The use of ceramic material provides consistently high insulation resistance. As a result, you can install this relay closer to engines. You often can use it *without* temperature controlled boxes. Always, you will find it supremely rugged and reliable.

High in shock resistance. This new UNION Relay withstands shock *greater* than 55 g for 11 milliseconds—and continues to operate. In vibration tests, it shows no contact chatter up to 2,000 cycles at an acceleration of 25 g.

New high in contact reliability. Contact reliability of this relay is *six times* that of comparable devices because of its new 2-button, bifurcated contacts. Bifurcation also increases current carrying capacity (each button easily handles a full 2-ampere load) . . . and makes gold alloy contacts practical for both low- and high-level loads.

Contact reliability is enhanced, too, by the ceramic insulation which contains no volatile material to contaminate contacts and by separate hermetic sealing of the magnet coil.

New torsion-type rotary-armature suspension improves resistance to thermal shock . . . increases reliability over the entire temperature range . . . and greatly extends the operating life of this new 4PDT relay. Call or send the coupon for complete information about this and other miniature relays manufactured by Union Switch & Signal.

MANY VACUUM INDUCTION MELTED METALS AND ALLOYS CAN NOW BE PRODUCED IN HEAT SIZES UP TO 5,000 LBS. BY UTICA METALS DIVISION

announcing Udimet 600 and 700

for a wider range of applications at elevated temperatures!

With the development of these two new alloys, the Utica Metals Division of Kelsey-Hayes scores another materials "break through" with vacuum induction melting. Producible only by the vacuum induction melting process, *Udimet 600 and 700 surpass the elevated temperature properties of any other known alloy which can be produced in quantity for critical high-temperature, high-stress requirements.* They not only possess excellent stress-rupture qualities but also exhibit high tensile strength at temperatures above 1500°F.

Like Udimet 500, Udimet 600 is now available in production quantities. Udimet 700 is available for development applications. Write for complete information.

vacuum induction melting develops

- High-temperature corrosion resistance
- Increased ductility
- Extreme cleanliness
- Precise chemical control
- Longer stress-rupture life
- Increased tensile strength
- Better fatigue resistance
- Greater yield strength
- Greater impact resistance
- Greater creep properties

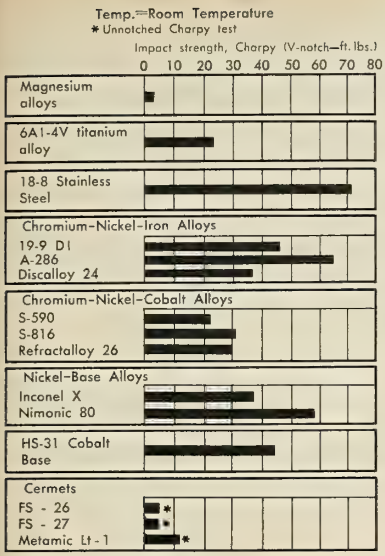

Fig. 4—Comparison of impact strength of various structural materials.

ture requires further investigation of its brittle, stain-rate and notch-sensitive characteristics, its use seems feasible.

Development of adequate coatings for molybdenum amounts to a major engineering effort. A number of manufacturers are spending considerable effort on this problem.

Tungsten, tantalum and rhenium all have very high-density and high-temperature resistance. They are very scarce, are difficult to produce in specific shapes and their future development is unpredictable. Their use would be restricted to local structural components.

Carbon has the best strength-to-weight ratio above 3000°F. Its availability is good, but its potential development is probably limited. Carbon and carbides would also probably be restricted to local use.

Cermets and ceramics have good temperature-resistant characteristics. Their greatest disadvantage is their inherent notch sensitivity and poor impact strength. The value of ceramics, particularly oxides, is their oxidation resistance. Their greatest use will probably be as coatings for efficient structural materials, and as parts subjected to high temperatures, but low or nonexistent stresses.

Existent ceramic coatings are used to: (1) substitute less strategic alloy without sacrificing life; (2) increase life of existent parts; (3) allow use of existing parts at higher temperature.

In their use, these coatings take the following forms: (1) refractory coatings (*viz.*, for tank mufflers, 3 to 8 mils thick); (2) very thin vitreous coatings (NBC A-418 for jet parts); (3) refractory oxide, carbide or nitride cermet coatings (Ni-MgO flame-sprayed coat for combustion liners); (4) refractory insulating coatings attached to base metal by cementing or by mechanical means; (5) "ceramic paints" which can be brushed on and require no firing prior to use.

Less progress has been made in evaluation of mechanical and thermal properties of nonstructural materials than on primary structural materials. This status is indicated in Fig. 3 and may be outlined as follows:

Radomes

Glass fibers impregnated with silicone resins are limited to about 900°F. Radomes of Al_2O_3 are usable to 1500°F. Pyroceram 8606 has good strength up to 1500°F. These materials appear favorable strengthwise for anticipated radome temperature of 1200°F for one and one-half hours. Simple surfaces and flush mounting in design favor use of ceramic dielectrics.

Potential methods of ceramic randome fabrication are (1) Solid-wall high-temperature glass, high-temperature porcelain, high-temperature synthetic mica (with a glazed surface), and high-temperature sintered Al_2O_3 or Zr_2O_3; (2) ceramic air-spaced sandwich (with ceramic internetwork for rigidity); (3) inorganic cement plus glass fiber; (4) glass foamed in place sandwich and artificially loaded foams.

Windows

The need for windows is not established one way or the other. Successful development of a solder glass interlayer may extend temperature usage from the present 350° to 800° or 1200°F. If better scratch-resistance could be built into solid glass, temperature limits could be raised to 1500° or 1800°F, and even 2500°F, for short periods. Glider windows protected by cooling, or eyelids, which can withstand 1800°F, may be useful.

Seals and Sealants

Assumed design life will have

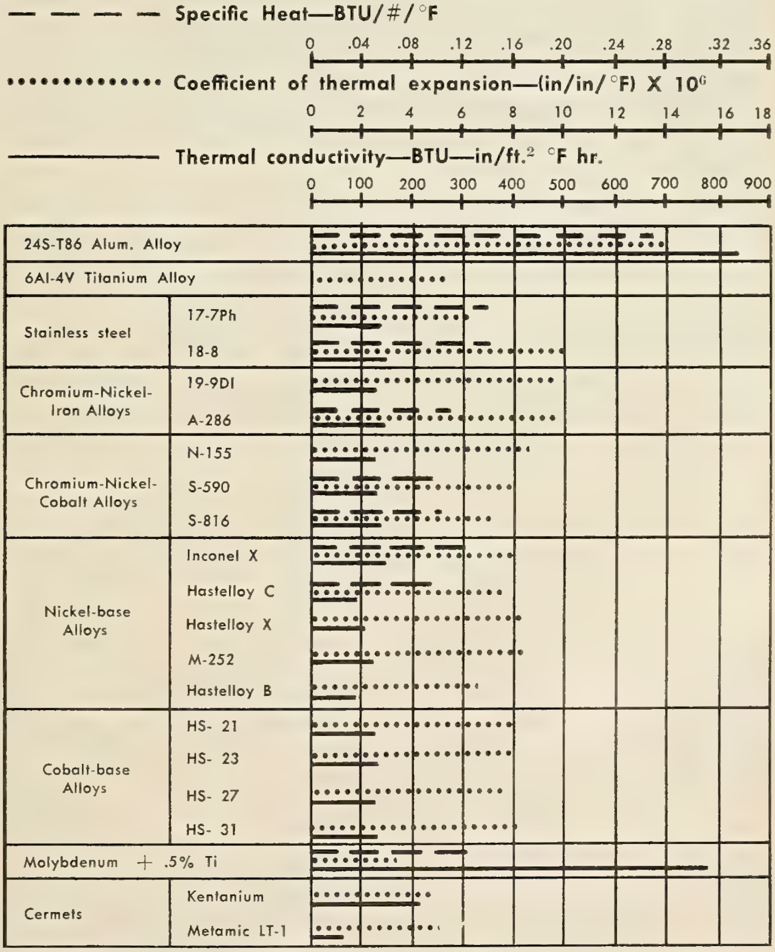

Fig. 5—Comparison of thermal properties of various structural materials, 700°F.

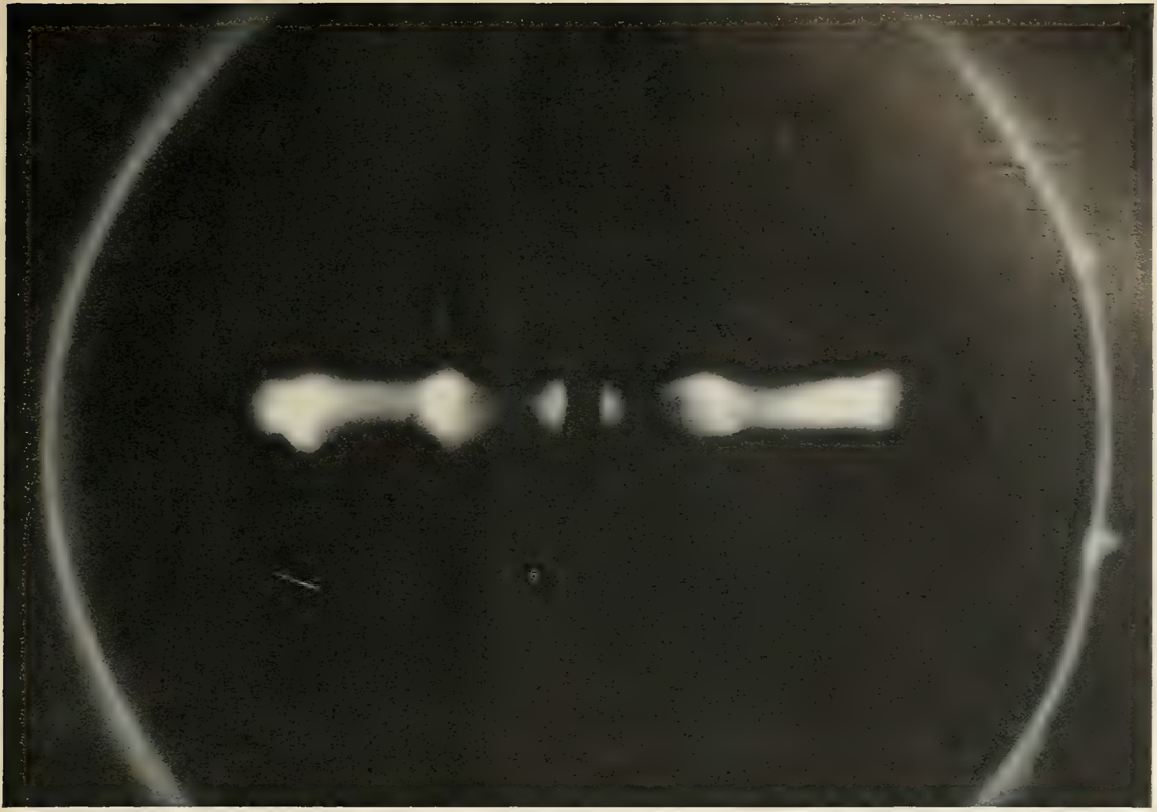
Metal	Melting Point (°F)	Density (lbs/cu. in.)	Characteristics	Short Time Tensile F_{tu} Ksi at —°F	Vapor Pressure at Melting Point (mm. Hg) ((-3)=10^{-3})	Oxidation Resistance in Air	Order of Probable Feasibility for 2000°F Structure	Miscellaneous Comments
Tungsten (W)	6150	0.70	Good: high-temp. strength Poor: oxidation resis., ductility, fabrication	120-300 at R.T.; 32 at 2500°F; 3.4 at 4100°F	1.75 (—2)	Forms nonprotective oxide 900-1400°F; oxide volatile at high temperature	3	
Rhenium (Re)	5750	0.73	Good: high-temp. strength Poor: very scarce	48 at 2500°F; 9 at 4000°F	2.45 (—2)	Resistance is five times cermets at 2500°F	3	
Tantalum (Ta)	5425	0.60	Good: high-temp. strength Poor: oxidation resis. and some mech. properties	50-110 at R.T.; 6.7 at 5000°F	5 (—3)	At 896°F weight gain due oxidation is 1% per 24 hours; poor resistance to air at elevated temperature	2	Softening temperature of 810-1170°F for pure Ta
Osmium (Os)	4890	0.82	Poor: high cost, oxidation resis., unworkable	Approximately 160-200 at R.T.		Rapid oxidation in air at elevated temperature; oxide is volatile		Completely unworkable in pure state
Molybdenum (Mo)	4760	0.37	Good: high-temp. strength, abundant Poor: oxidation resistance	13° at R.T.; 10 at 2500; 5.24 at 4500	2.2 (—2)	Forms volatile trioxide above 930°F	1	With siliconized coat may be used for extended time; with Ni, or Inconel clad use in air to 1800-2000°F
Ruthenium (Ru)	4530	0.44	Poor: high cost	Approximately 115-190 at R.T.	9.8 (—3)	Similar to Ir in corrosion resistance		
Iridium (Ir)	4450	0.83	Poor: high cost	Approximately 100-160 at R.T.	3.55 (—3)	Slight oxidation at 1100-1850°F; oxide volatile > 1850°F		
Niobium (Columbium Cb)	4380	0.31	Good: high-temp. strength Poor: oxidation resis., ductility	48-60 at R.T.	6.4 (—4)	Oxidizes above 500°F in air; forms nonprotective oxide (0.052% wt. gain/5 hours at 662°F)	2	Softening pt. Cb ≅ Ta (800-1170°F)
Hafnium (Hf)	3830	0.47	Poor: very scarce			Oxidizes readily in air, similar to Zr but O_2 penetration into metal is slower.		
Rhodium (Rh)	3625	0.45	Poor: high cost	73-300 at R.T.	1 (—3)	Oxidizes at 1475°F rapidly; oxide volatile > 1830°F		
Chromium (Cr)	3435	0.26	Poor: high vapor pressure	40-60 at R.T.	63.5	Forms protective oxide scale W. maximum temperature stability 1650°F	6 (Alloyed)	
Zirconium (Zr)	3325	0.24	Poor: oxidation resis., med.-high vapor pressure	90 at R.T.	1.4 (—5)	Loss of strength becomes significant above 900°F	5	More plentiful in earth than Cu, Ni, Pb; is 2 years behind Ti development; low neutron absorp. cross-section
Thorium (Th)	3320	0.41	Poor: high-temp. strength, therm.-stress resistance	37 at R.T.; 17 at 900	9.3 (—5)	Highly reactive at elevated temperatures		
Platinum (Pt)	3225	0.78	Poor: high cost	19 at R.T.; 4 at 1800°F	1.6 (—4)	Good to 2700°F for short times; oxide volat. > 1600°F		
Vanadium (V)	3155	0.23	Poor: med.-high vapor pressure	70-110 at R.T.	1.2 (—4)	Above 300°F must be protected from oxide, hydride and nitride formation		
Titanium (Ti)	3140	0.16	Poor: high vapor pressure	90-100 at R.T.	8.4 (—2)	Forms protective oxide scale, embrittles between 1100-1800°F oxide porous; > 1800° oxide may sinter together.		Not recommended for continuous service over 1000°F (At 1800°F 6Al-4V has 95 mg/cm^3/48 hours, cumulative wt. increase/orig. unit area.)

Fig. 6—Status of high-melting-point metals.



Magnetic fields, acting as a double piston, drive luminous ionized shock waves through transparent tube. One-tenth microsecond exposure in STL's Physical Research Laboratory.

MAGNETOHYDRODYNAMICS and SPACE TECHNOLOGY

Magnetohydrodynamics provides one of the most promising approaches for attaining the velocities and specific impulses that will be required for manned space flight to a planet, landing, and returning.

The critical problem in attaining velocities of hundreds of thousands of miles per hour is the containment of temperatures comparable to those in the interior of stars. Because the temperature of the driving reaction will have to rise as the square of the exhaust velocity, temperatures greater than one million degrees will be encountered in reaction chambers. Magnetohydrodynamics offers a unique solution to the basic problem of containing the reaction without contact with the chamber walls.

Briefly, the physical principles of magnetohydrodynamics are these. Since gas at such temperatures is completely ionized and is an effective conductor of electricity, the introduction of currents in the gas (in this state called a plasma) creates an electromagnetic field. This field makes it possible to control the plasma by applying an external opposing magnetic field which creates a magnetic bottle to contain the charged gas particles. Similarly, a magnetic-field piston can be used to accelerate the particles. Such magnetohydrodynamic reactions are expected to develop exhaust velocities that are an order of magnitude greater than those generated by present chemical rockets.

At Space Technology Laboratories, both analytical and laboratory work are proceeding in the field of magnetohydrodynamics. This work illustrates the advanced research in STL's Physical Research Laboratory, which emphasizes the application of basic physical principles to the requirements of space technology.

In support of its over-all systems engineering responsibility for the Air Force Ballistic Missile programs, and in anticipation of future system requirements, STL is engaged in a wide variety of research and experimental development activity. Projects are in progress in electronics, aerodynamics, propulsion, and structures.

The scope of work at Space Technology Laboratories requires a staff of unusual technical breadth and competence. Inquiries regarding the many opportunities on the Technical Staff are invited.

SPACE TECHNOLOGY LABORATORIES

A Division of The Ramo-Wooldridge Corporation

5730 ARBOR VITAE STREET • LOS ANGELES 45, CALIFORNIA

great influence on the choice of sealing materials. Smoothness to reduce hot spots can be maintained with 250° to 350°F. Development work on silicone rubber should allow approximately 750°F for fillets and faying surfaces. Inorganic materials may permit over 1000°F for use. Sealant temperature capacities require further investigation.

Hydraulic Fluids

Development of hydrogenated aromatic mineral oil or methyl phenol silicones may extend the current 350°F limit for silicone base fluids. Where hydraulic fluids are a limitation, other types of mechanisms can be devised.

Bearings and Lubricants

Targets for the next five-year period will probably be 300 to 450°F for sliding friction applications and 750 to 1000°F for antifriction bearings. High-temperature greases of improved lithium soap base with aryl urea thickener are currently being evaluated. Development may extend this to 1000°F.

Bearings and lubrication for movable control surfaces which can withstand 2000°F are desirable. In the folding wing-tip area, use of boron nitride to prevent freezing, and air-pressure blown into a ball and race during movement, may be feasible. Other approaches may be fabrication of high-temperature bearings of hot-pressed synthetic mica impregnated with boron nitride or some type of cermet.

Electrical and Thermal Insulation

Electrical insulations of organic types are limited to lower temperature applications. Fibrous ceramic thermal insulation may prove usable to 3000-to-3200°F with acceptable reductions in properties. Various emissive and reflective coatings become effective above 1200°F. Ceramic honeycomb sandwich may have good thermal insulating properties, but requires further development.

Fig. 8—Temperature properties of refractory metals.

Coatings

Aluminum silicone paints provide oxidation resistance for metals to approximately 1200°F in still air, and about 900°F in Mach 0.8 air. Vitreous ceramic coatings will protect stainless steel 321 from oxidation for several hours at 2200°F or for 150 to 300 hours at 1600°F.

Molybdenum has been protected for several hours in still air at temperatures to 2800°F and for over 300 hours at 1800°F. Protection can be provided by several metallic and ceramic materials or a composite of layers of different materials.

It is felt that the conditions used in evaluating the above coatings may not adequately represent rocket environments. This subject requires further consideration.

Another important design factor is the ratio of tensile strength to density versus temperature for various materials. Generally speaking, an increase in weight becomes necessary due to higher temperature environments.

Udimet 500 and Inconel X are the most efficient in the 1000° to 2000°F range, but exhibit an extreme sensitivity in strength with small temperature changes. The strength of Udimet 500 at 1500°F decreases 50 per cent at 1700°F.

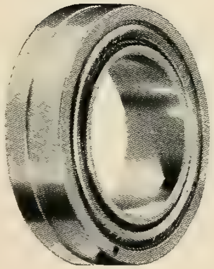
Inconel has a strength at 1700°F which is 70 per cent of its 1500°F strength. Thus, a 200°F temperature design error (which is a 10 per cent error on the absolute temperature scale and is acceptable engineering accuracy considering the present state of temperature prediction techniques) has a drastic effect. This means that the less efficient material, molybdenum, is favored for use at 1500°F when the sensitivity to temperature is given heavy emphasis.

Fig. 4 is a comparison of several standard structural properties; that is, impact strength and thermal properties. Most of the metals have acceptable impact resistance. The cermets and ceramics have poor impact strength and the strength indicated on the bar graph may be somewhere of the order of 10 times less than indicated here.

Efforts directed toward increasing cermet impact resistance by cladding or infiltration techniques have given some increase in strength, but a major breakthrough in strength has not yet been achieved.

FIRST 1000 M.P.H. CARRIER-BASED FIGHTER

JOINS THE FLEET



Continuing a four-decade tradition of "firsts" in naval aviation, Chance Vought delivers the first 1000 plus m.p.h. aircraft for duty with the fleet—the F8U-1 Crusader.

As in most aviation firsts, Shafer Aircraft Bearing performance makes a vital contribution. In the Crusader, that performance is ample bearing capacity in higher than normal temperature ranges at key points in control systems.

Advanced Shafer research in bearing design and materials can make an important difference in your plans for the future. Take the first step today: write for Catalog 54. Shafer Bearing Division, CHAIN Belt Company, 801 Burlington Ave., Downers Grove, Ill.

SHAFER®

BEARING DIVISION
CHAIN BELT COMPANY

Circle No. 39 on Subscriber Service Card.

It is not known if basic work on composition, dispersion of nonmetallics in metallic phase, particle size and shape will be the answer. This condition places increased emphasis on the refractory metals.

The thermal superiority of molybdenum is due to a combination of high thermal conductivity and low thermal expansion, with a conventional specific heat. This combination is desirable in areas of high heating rates, high temperatures, and high thermal stresses.

As a vehicle's heat sink capacity is exhausted during flight, the heating rates decrease. Molybdenum would decrease in thermal conductivity with resultant reduction in heat conduction and cooling requirements, but at the cost of higher skin temperatures.

High Melting Point Metals

Molybdenum, tantalum, tungsten, and columbium (niobium) are the most feasible metals for development as elevated temperature structural materials on the basis of melting point, availability, price and vapor pressure.

The significance of melting point, availability, and price in determining feasibility is more readily apparent than is vapor pressure. The effect of vapor pressure is shown in the following table (from HIGH TEMPERATURE TECHNOLOGY by I. E. Campbell, Wiley & Sons, 1956):

Metal	1% Vaporization per 100 hours Temp. °F	Melting Point Temp. °F
Tungsten	4640	6150
Tantalum	4350	5425
Rhenium	4315	5750
Niobium (Columbium)	4045	4380
Osmium	3830	4890
Iridium	3615	4450
Molybdenum	3470	4760
Ruthenium	3450	4530
Rhodium	3040	3625
Platinum	2910	3225
Zirconium	2730	3325
Vanadium	2625	3155
Titanium	2030	3140
Chromium	1645	3435

Not much published information is available regarding properties of binary and more complex alloys of Mo, Ta, W and Cb, and those involving small amounts of the platinum group (osmium, ruthenium, iridium, rhodium). Apparently these are being investigated by people like Battelle who believe that in this area developments may lead toward practical metallic materials for high-temperature service.

Density at about 1700°F, the strength-to-weight ratio of molybdenum plus 0.5 per cent Ti becomes increasingly superior with increased temperature when compared to such materials as cermets and superalloys. Additions of small amounts of Cb, Co, Zr, and V to molybdenum are under investigation at Climax Molybdenum.

Areas of high-temperature materials for future investigation are: (1) cermet evaluation; (2) composite structures; (3) development of new and unknown high-temperature compounds; (4) corrosion protection (Convair work includes study of ceramic-coated aluminum mild steel, stainless steel and titanium); (5) structural uses of cermets and reinforced ceramics (including ductile ceramics); (6) high-temperature adhesives (ceramic bonded aluminum and stainless lap shear joints are being developed); (7) erosion protection (flame-sprayed ceramics are being investigated); (8) thermal and radiation reflectivity at elevated temperatures; and (9) thermal insulation.

Miscellaneous applications are: (1) rocket nozzles and combustion liners; (2) high-temperature bushings, gaskets and shroud rings; (3) internal pump parts for handling molten materials; and (4) electric insulators, dielectric materials and separators in vacuum tubes.★

The views expressed in this article do not necessarily reflect those of Convair.

ORDNANCE

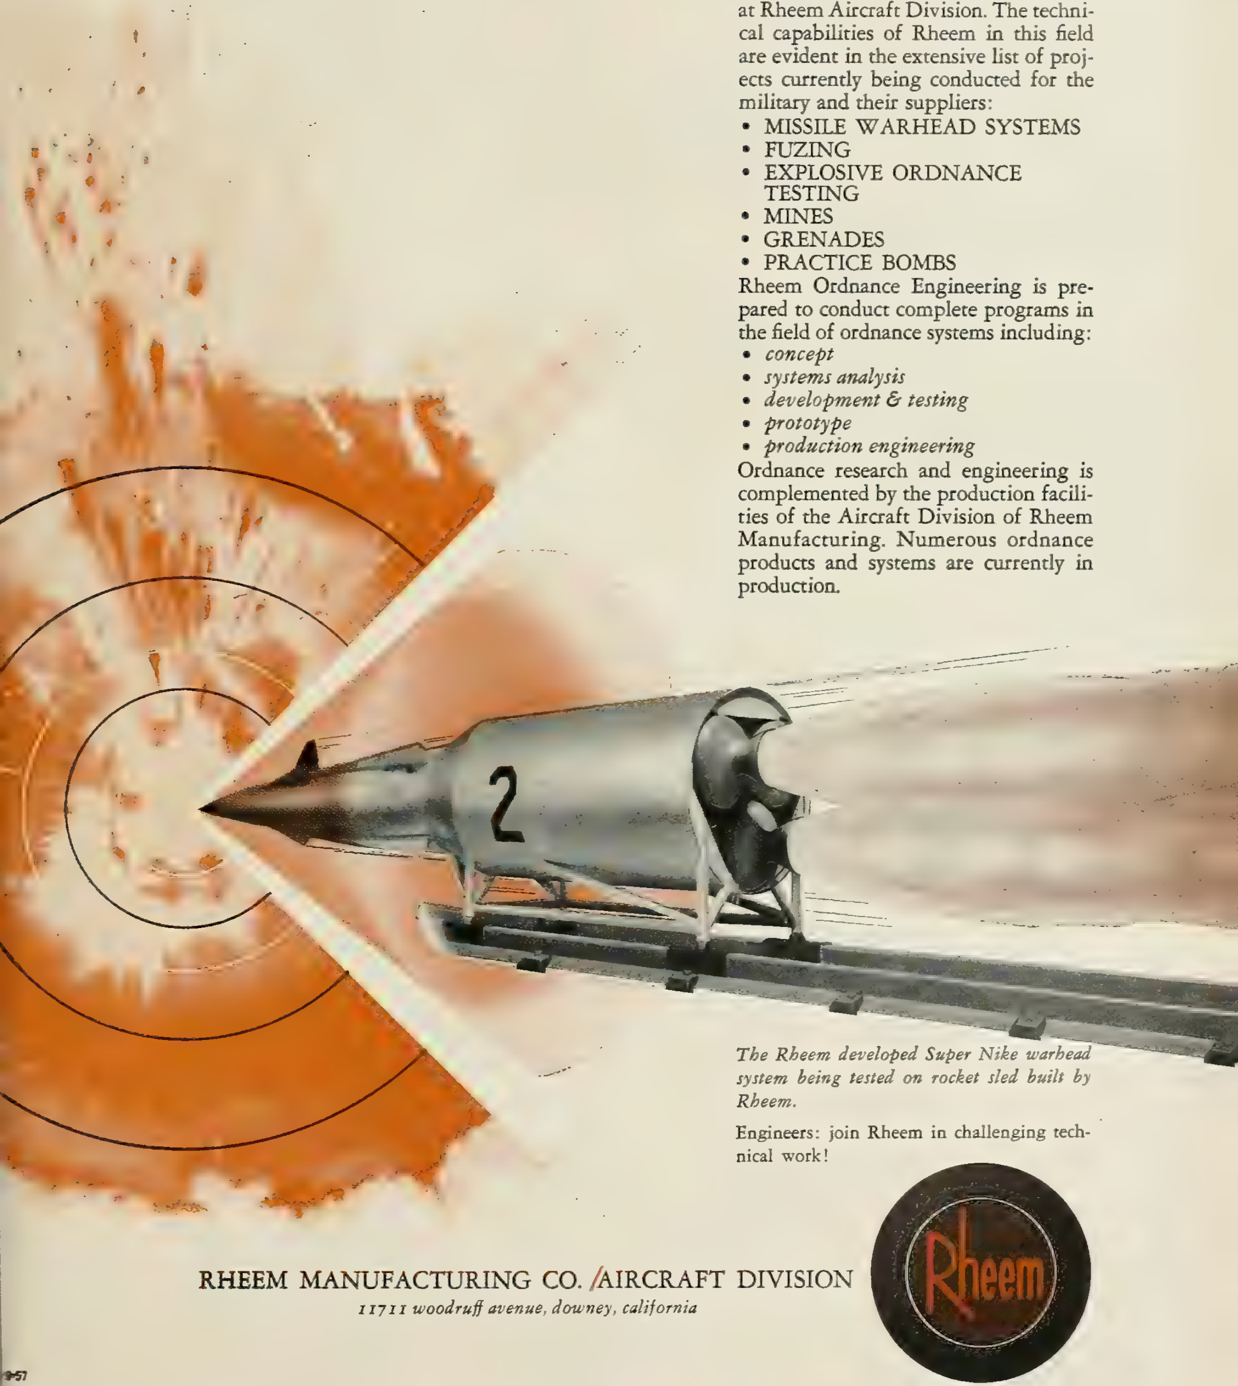
The design, development and testing of advanced ordnance products and systems is one of the principal activities of the Research and Development group at Rheem Aircraft Division. The technical capabilities of Rheem in this field are evident in the extensive list of projects currently being conducted for the military and their suppliers:

- MISSILE WARHEAD SYSTEMS
- FUZING
- EXPLOSIVE ORDNANCE TESTING
- MINES
- GRENADES
- PRACTICE BOMBS

Rheem Ordnance Engineering is prepared to conduct complete programs in the field of ordnance systems including:

- *concept*
- *systems analysis*
- *development & testing*
- *prototype*
- *production engineering*

Ordnance research and engineering is complemented by the production facilities of the Aircraft Division of Rheem Manufacturing. Numerous ordnance products and systems are currently in production.



The Rheem developed Super Nike warhead system being tested on rocket sled built by Rheem.

Engineers: join Rheem in challenging technical work!

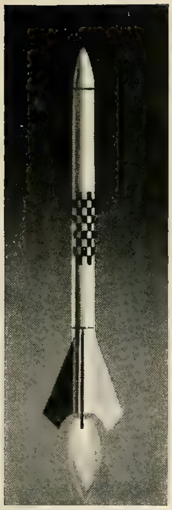
# of missiles and men

TO SERVE THE GROWING EDITORIAL NEEDS OF THE MISSILE MEN . . . SCIENTISTS . . . EXECUTIVES . . . ENGINEERS . . . PRODUCTION AND DEVELOPMENT PEOPLE . . . *MEN WHO SPECIFY AND BUY* IN THIS DYNAMIC NEW MARKET, MISSILES AND ROCKETS WILL BE PUBLISHED WEEKLY STARTING JULY, 1958.



MISSILES AND ROCKETS AND THE MAN

Missile experts write specifically for missile men, providing technical news and views, features, engineering, electronics, and business information. This editorial appeal assures you of maximum readership . . . vitally interested readership as proven by a paid circulation, after only 15 months, of 22,000 ($8.00 for year's subscription). And there's no waste circulation . . . all subscribers must be engaged in missile work.

MISSILES AND ROCKETS AND THE MARKET

From a $21 million industrial infant in 1951, the missile market has expanded to a $3.5 billion giant. Many related fields are represented—electronics, chemicals, metals. You can reach this specialized market with ONE magazine . . . MISSILES AND ROCKETS. For MISSILES AND ROCKETS is designed to serve as a forum for the interchange of specialized information and ideas for the missile man on all levels and in all areas of this new, fast-growing market.

THE ADVERTISER AND THE MAN

Since October, 1956 when MISSILES AND ROCKETS began publication, there have been 431 individual advertisers! By next July when MISSILES AND ROCKETS goes weekly, there will be many more! In order to find out how effective your advertising is to the missile man, readership surveys will be conducted by Mills Shepard and his research staff in the March issue, the first July News Issue, and the first September Feature Issue. . . . Now you can take advantage of a combination rate for MISSILES AND ROCKETS and AMERICAN AVIATION to obtain the best earned frequency rate for each publication. Contact the nearest Regional office for additional information.

a new missile material . . .

Welded Stainless Steel Hollow Core

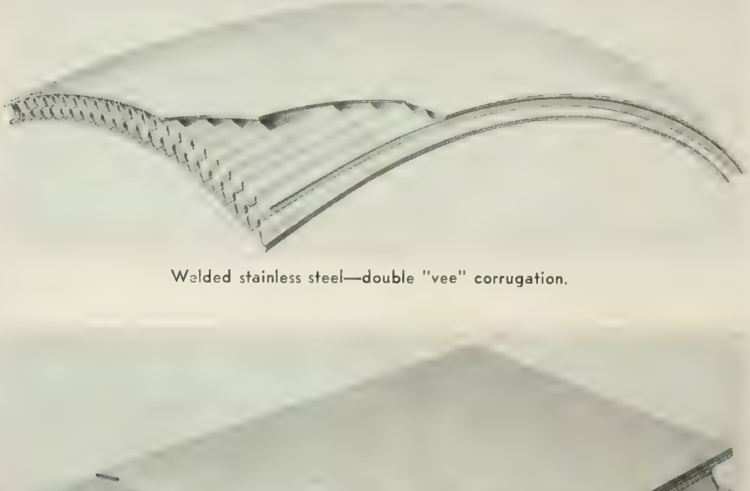
by Dr. Michael Watter

MISSILE AND aircraft structures, although they represent only a part of the weapon system, play a vital role in the performance of the whole system and confront the designers with many new problems. The task confronting the industry is twofold:

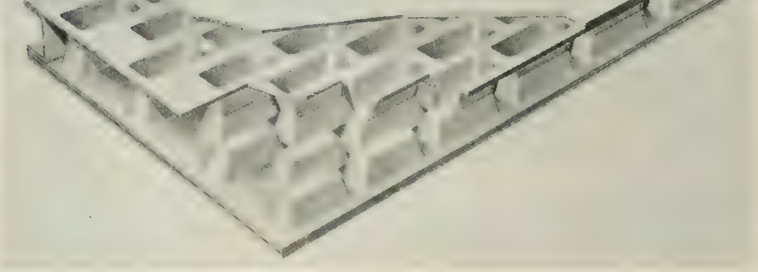
One is to create the most advanced weapons compatible with just enough of the extrapolation of known means as to be able to reduce the time between design and its experimental realization; second, to push aggressively research of all phases necessary to assure maximum future weapon potential if there be time to take advantage of it.

Because of their novel features, this article stresses the subject of integrated core structures and is limited to a few typical examples designed and built to meet specific requirements. They emphasize the fact that each structure must be patterned to suit the specific loading and environment conditions of the design problem.

Budd integrated core structures utilize several basic types of integrated core sandwich panels. One type employs a double "vee" corrugated core, while in another type the core is of a stamped type made of two pieces. In both cases the core sheets are welded together on the neutral axis and then, in turn, to each face sheet.



Welded stainless steel—double "vee" corrugation.



Welded stainless steel—double elongated waffle panel.

Still another type employs a single "vee" core welded between two face sheets. The specific dimensions of the panels, gauges of the core and face sheets, as well as the material used, are selected to meet best the engineering requirements of the problem. The materials are those satisfying the temperature and design requirements and suitable for resistance welding.

The significance of resistance-welded structures lies in several well-established but not generally known factors. For instance, because spot welding causes local reduction in the tensile strength of the weld nugget, it is sometimes thought that this local reduction limits the strength of the structure.

Actually, however, a lap joint with a double line of welds, made either of cold-rolled or heat-treated-prior-to-welding material, may have an efficiency in tension of over 95 per cent. With a small amount of additional material, tension joints can approach 100 per cent efficiency.

The development and present availability of the extra hard 301 stainless steel with its high physical properties, as well as the utility of increasing the strength of heat treatable alloys by subsequent cold reduction, stems from their ability to utilize effectively high strength in resistance-welded structures.

In addition to the 301-type stainless steel, the same high-strength properties can be obtained in 201-type as well as austenitic stainless alloys which do not contain nickel, such as Tenelon and TRC.

The geometry of the integrated

Dr. Watter is Director, Airframe Research Defense Div., The Budd Co.

core makes it possible to fabricate structures of exceptional efficiency from either cold-rolled, or heat-treated and subsequently cold-rolled alloys supplied directly by the mills with their highest physical properties.

Structures of the integrated core type can be fabricated as cylinders, cones or as surfaces of compound curvature which make them eminently suitable for rocket motor and missile structures. The directional characteristics of the single and double "vee" type of sandwich prove to be significantly advantageous in a number of missile structures because the core is a load-carrying member in addition to its contribution to the rigidity of the panel.

Because of the nature of the manufacturing method, missile shells, rocket motor casings, bulkheads and other missile structures are not limited in size, disposition of the internal or external structure, or the location of fittings. Their dimensional accuracy is assured by progressive fabrication permitting corrective adjustments without encountering problems normally present in heat treating large and usually considerably less rigid assemblies.

In the course of design experience, it has been found that these structures are very effective in a wide range of applications. For instance, they can be proportioned to have either low thermal conductivity or, when needed to minimize thermal buckling, a rather high thermal conductivity without sacrifice of their structural efficiency. They are also eminently suited for situations which would require cooling.

The availability of 301 stainless steel with an ultimate strength of 300,000 psi and the effectiveness of resistance-welding techniques of assembly have resulted in appreciable gains in structural efficiency in several applications which did not require resort to a sandwich construction. In other instances where high-temperature conditions were present, other alloys such as A-286 and L-605 were employed with satisfactory results.

Airframe and missile structures confront the designer with two—or a combination of two—basic problems. In the case of airframes, the problems predominantly fall in the class customarily called elastic stability, while in the case of missiles they also often involve problems of tensile strength.

As stated, many of the materials potentially important in missile and airframe structures can have their physical properties enhanced through cold working, irrespective whether these materials fall into the category of heat-treatable alloys or alloys whose high physical properties can be obtained only through cold working.

These cold-reduced materials

often possess highly anisotropic properties. In addition, many composite structural elements do not or need not display isotropic behavior. The treatment of anisotropic plates is found in a number of classical texts familiar to structural engineers and requires no further discussion. The subject of anisotropic materials, however, has not been widely treated.

The necessity of analyzing structures to be made in 301 stainless steel offered another useful discipline, since classical elastic behavior is not the virtue of the material. It thus became necessary to consider the true behavior of the material which was done by applying the usual methods of inelastic behavior, *i.e.*, behavior displayed by materials in the region beyond proportional limit.

To simplify routine calculations it is useful to prepare a series of effective curves for buckling, crippling, bending and shearing. In this instance, buckling is defined as a recoverable deformation while crippling denotes a permanent failure. In treating the subject of buckling of anisotropic materials, this author combined the inelastic behavior beyond proportional limit with the treatment of buckling of plates reinforced by ribs. The sufficiency of this approach for engineering analyses has since been supported by Bureau of Standards tests, the author's company's experience, and independent tests.

In the problems of missile shell design one often encounters the problem of tension, which may appear to offer no chance to apply design and analytical skill. Actually, this is not necessarily the case. The structure is always more complex than a simple tensile test coupon and hence there are problems of making joints, providing local attachments and assuring maximum rigidity of the shell particularly when fabricated in very large sizes.

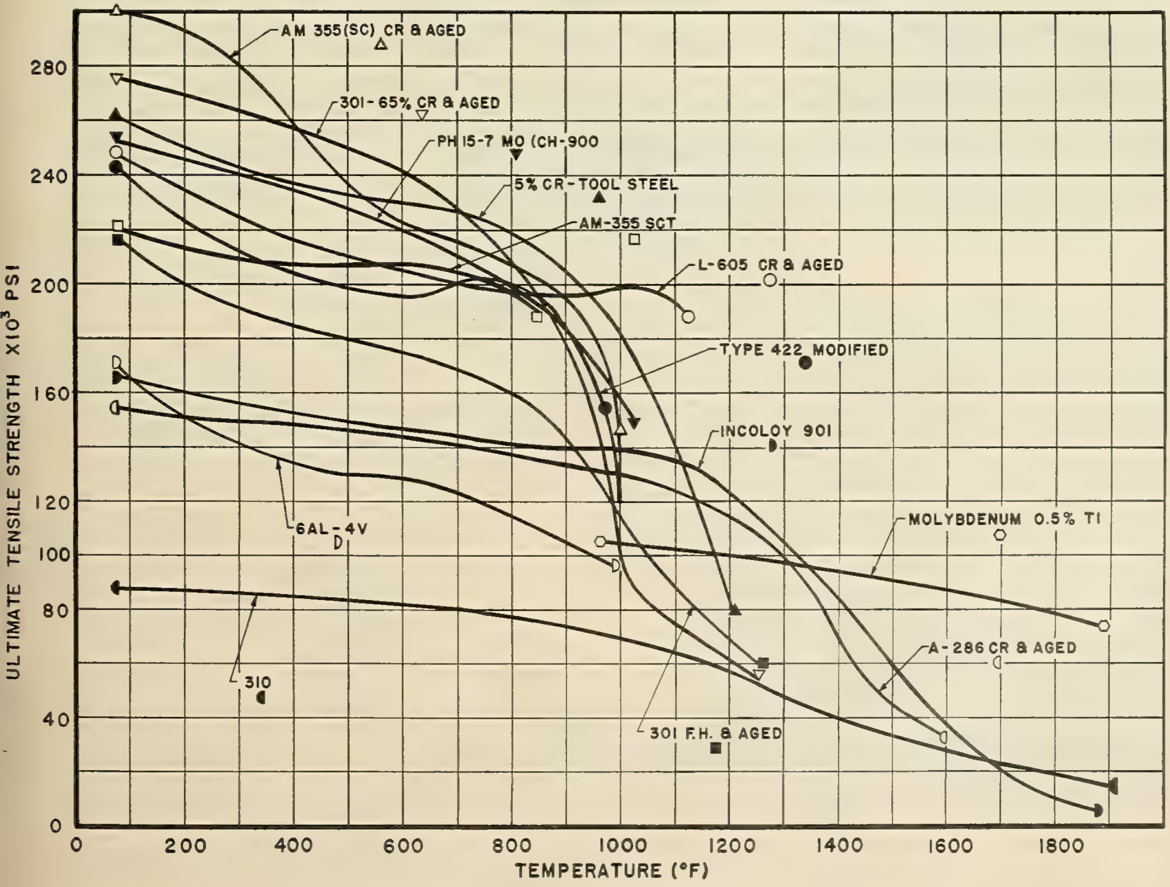
Competent proportioning of the structure can, however, assure only its theoretical correctness. Since resistance-welded design differs radically from either brazed or mechanically fastened design, the sequence of assembly must be well thought out and established by the designer in cooperation with tool engineers; it must take cognizance of the fabricating techniques and welding tools.

Welding limitations, although very much fewer than generally thought, do exist, and incorrect sequence of assembly can prejudice both the structure and the ability to fabricate it.

The problem of designing resistance-welded structures subject to fatigue is not different from that involved in any other structure, except that it requires specific experience. In one aircraft company, there was a sign across the drafting room which said "Don't forget the fillets!"

All structures must guard against "stress raisers" but where to look for them and how to cope with them is a matter of good judgment and accumulated knowledge.

Resistance welding has been and is used successfully in many structures subject to severe vibrations. It has been used for aircraft fuel and oil tanks; it is extensively used in jet engines, afterburners and other locations having drastic service requirements. It can assure pressure tightness, fuel tightness, ability to withstand sonic vibrations,



Ultimate tensile strength of various materials plotted against temperature.

but one must provide a correct design and use suitable materials.

To expect that it can be used under all circumstances is unreasonable. Under certain conditions, considering the design limitations and service requirements, competent designers will not attempt to use resistance-welded structures—in many other cases only service or well-conceived simulated tests can establish what type of structure will meet the requirements.

Properly designed resistance-welded structures display a very favorable fail safe behavior. It limits crack propagation and having failed under excessive loading, in bending or compression, most of the time can still support a major percentage of the load which caused failure. The speed brake, referred to above, after having failed at 130 percent of ultimate load, supported about 70 percent (almost the limit load) without further distress.

Materials

In order to view the materials in the light of their possible application to actual structures, they must be considered not just on the basis of their physical properties, but on the available means of joining and forming.

Materials which derive their high physical properties at room and elevated temperatures only through cold reduction, such as 301, L-605, and A-286, can be joined advantageously only by resistance welding in this condition.

To proportion the structure in a given material, complete information must be available in the form of stress-

Acme-Newport Steel

CLEAN, SOUND, ACCURATE STEELS* FOR THE SKY

*Plate, sheet and strip in aircraft-quality alloy and carbon grades

Modern facilities, technical and mechanical skill, and long diversified experience, enable this Company to meet your exact specifications for aircraft-quality plate, sheet and strip, including the important chrome-molybdenum AISI 4130 type. Acme-Newport aircraft-quality alloy and carbon steels are uniformly clean, sound, chemically accurate, and respond properly to heat treatment. In their sacred responsibility of producing vital defense equipment such as planes, guided missiles and Jatos, prime and subcontractors find this uncompromising quality more than adequate. Acme-Newport would like to discuss your requirements and their own qualifications as a dependable source.

strain curves which, in the case of cold-rolled materials, must include longitudinal and transverse curves both for tension and compression. Customary physical data must be consulted.

The significance of these data must be weighed not only in the abstract of test a coupon, but as a result of the material application in a specific structure. To illustrate this point one may consider the stress-strain behavior of some cold-rolled materials. These materials often exhibit a very low proportional limit which may lead the designer to fear a high cumulative permanent set of his structure.

Tests prove, however, that complete structures, properly designed, approach the ideal of Hooke's law throughout the working range of the structure. A rational explanation for this lies in the fact that, unlike a test coupon, in a complex structure under a given condition of loading only a few fibers of a few members are under maximum loading. Once this loading is taken off, the elastic energy of the complex structure plays its part in the recovery of the structure to its original state. It would appear to this author that a designer may justifiably hope that the strain temperature behavior may not prove as much of a problem as it would appear to be on the strength of data currently available from test coupons.

Budd's long experience in the fabrication of resistance-welded structures served as a valuable guide in the selected approach to fabricate Budd integrated core panels. It was decided that the important feature was to adopt a method which would allow the fabrication of panels not limited either in size, gauges or compound curvatures and, in addition, suitable to permit assembly of these panels into a complete structure with the necessary attaching members and fittings.

One of the fundamental problems in any structure is, of course, the technique of joining and the reliability of joints. Resistance welding has its specific problems which must be recognized and understood.

Just as in the design of resistance-welded structures one must adopt a special approach, so in their fabrication there must be employed ample safeguards and controls.

Having originated the first controlled method of resistance welding of stainless steel known as the "Shot-Weld" process, The Budd Co. early in its experience recognized the importance of proper methods, equipment and instrumentation required to assure safe and economic resistance welding.

Missile and aircraft structures accentuate the requirements necessary to assure reliable and consistent welded joints as well as dimensional accuracy with aerodynamic smoothness. (At this point it would be pertinent to interject that The Budd Co. resistance-welded panels have met known airframe and missile finish specifications.)

In addition to the techniques and safeguards of welding control familiar to the aircraft and missile industry, there are two additional quality control methods under development. One of these consists in the use of an entirely novel automatic weld controller. This device—and there are two types under development at the present time—controls the essential variables, namely current and time, to assure the weld of a required size and strength. It is able automatically to adjust these variables for different thicknesses. It is equipped with an automatic lockout so that, if the local conditions preclude making the required weld, the welding is discontinued and a warning signal is flashed to the operator.

The second method under development makes it possible to determine on the surface of the finished part the size of the weld nuggets as well as of the heat-affected zone and to obtain a permanent record without resort either to photography or X-ray.

This method shows considerable promise; the correlation between macro-etch and shear-test data and the information supplied by Perma-Weld, as this method has been named, has been encouraging.

In addition to these two methods of quality control, a third technique being employed is simple and conclusive. It consists of internal pressure tests. This is a nondestructive positive test visibly demonstrating the integrity and the pressure-tightness of each panel.

It is well known that the aircraft industry, with notable exceptions, views resistance welding with considerable concern. This attitude is both proper and understandable. Some of it stems from past experience when resistance welding was applied to low density alloys of high electrical conductance and high tendency to oxidation. More recent experience with high density alloys, although directed to materials eminently suitable for resistance welding, has sometimes failed because the latest techniques and equipment were not employed.

Currently there are both prime contractors and subcontractors in aircraft industry who have the required competence in resistance welding and are doing an excellent job. It is their experience that should be used as a criterion in assessing the value of resistance welding as a safe and effective method of fabrication.★

Preserver of Peace...
BOMARC

Official U.S. Air Force Photo

It tracks down an enemy at 300 miles

Described as the most potent of all ground-to-air defense missiles, the Bomarc pilotless interceptor, designed by Boeing, stands poised for the destruction of any "enemy" bomber within a 200-300 mile range. Its booster rocket has the power to hurl it more than 60,000 feet straight up; then, powered by two ramjet engines, it hurtles by electronic instinct to its target at up to 3 times the speed of sound. For this guardian of our homes and way of life, RCA has been privileged to supply important advance components of the guidance system.

at last:

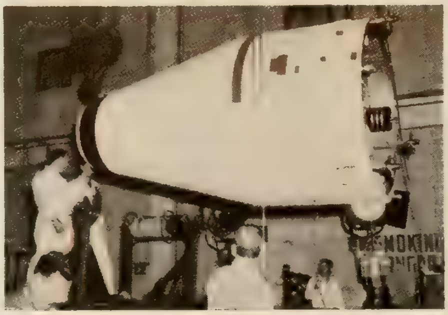
U.S. Satellite Aloft

by Norman L. Baker

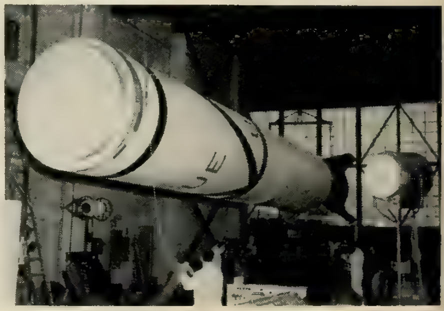
TEN FIFTY-EIGHT PM January 31, 1958—the date the United States officially entered space. Just as dramatic as the actual launching of the *Explorer* satellite was the conclusive proof that the early decision to divorce space research from military missiles was a very unwise decision indeed.

The launching climaxed almost four years of frustrated efforts by the Army to prove its rocket abilities and give the United States the lead in the race to space. It is now official that an *Explorer*, weighing approximately five pounds, could have started orbiting the earth on Sept. 20, 1956, when a four-stage *Jupiter*-C re-entry test vehicle flew 3300 miles over the Atlantic range. The last-stage rocket and satellite were replaced by dummies on direct orders from the Pentagon to prevent the Army from making an unauthorized satellite launching. Just 27 days from the official authorization and 86 days from the undocumented nod from Defense Secretary Neil McElroy, the Army's determination paid off.

Explorer II is on the pad at Cape Canaveral. Launching date: before April 1. The Army's role in the satellite field after *Explorer* II is highly speculative. Once again they must pool their proposed projects with those of the Navy and the Air Force and hope that the people who make the selection do not repeat the mistake of 1954, when the *Vanguard* was chosen over Project *Orbiter*.★



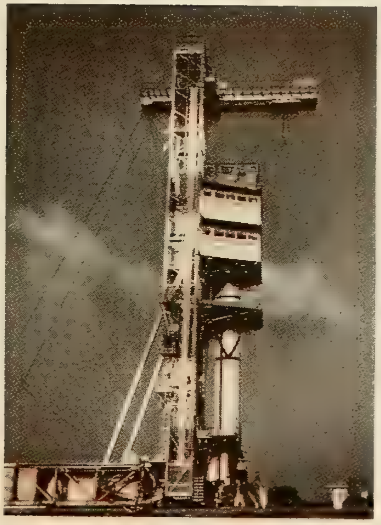
Control section of the EXPLORER launching rocket. This section positioned final stages to satellite launching attitude shortly after separation from first stage.



Modified REDSTONE first stage is prepared for checkout in the assembly hangar at launch site. Using a hydrazine-based fuel, booster lifted the satellite to approximately 56 miles above earth.

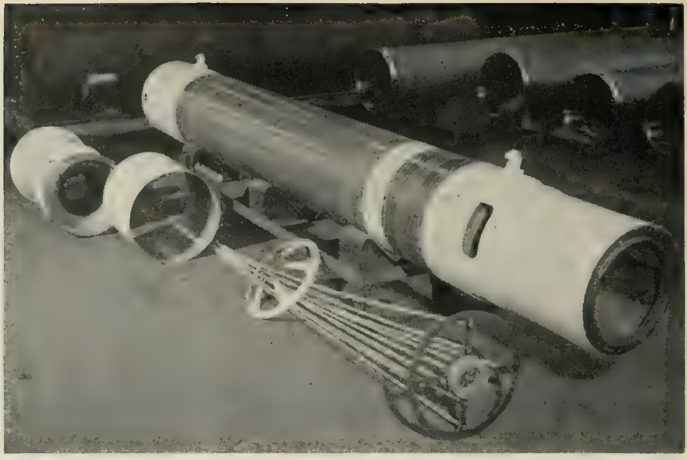
Sealed in polyethelyene to protect it from the elements, EXPLORER I is carried from instrumentation checkout trailer to gantry for mounting on fourth stage of the rocket configuration. Total electronic payload weight was approximately 11 pounds, total payload 17 pounds.

January 29th — Technicians check out the instrumentation and make final adjustments on the JUPITER-C's guidance and control in anticipation of an evening firing. High winds at upper altitudes forced postponement for 48 hours. Up to a few hours before launch the jetstream was reported to be producing blasts up to 200 mph.

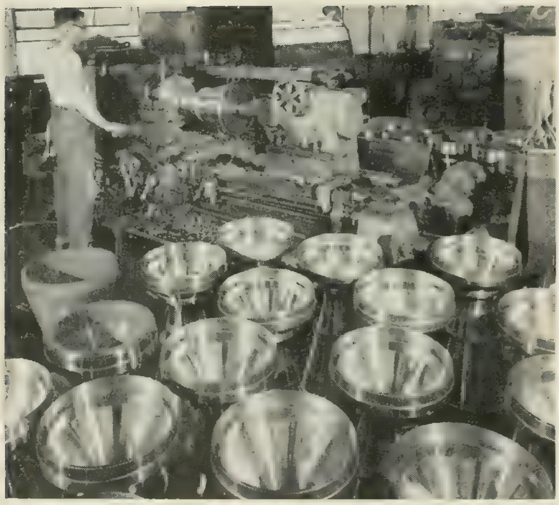


January 31st — With countdown for launching under way and proper weather conditions assured, last minute checkouts induced unwarranted tensions. Fuel spillage caused several minutes delay when leakage was suspected. At countdown "zero" missile pressurization was started. Ignition started at X plus 14 seconds. The rocket took off at 15.75 seconds after "zero."

Case for GOODYEAR



A plastic-impregnated, fiberglass NIKE rocket, manufactured by Goodyear while investigating better ways to make the boosters.



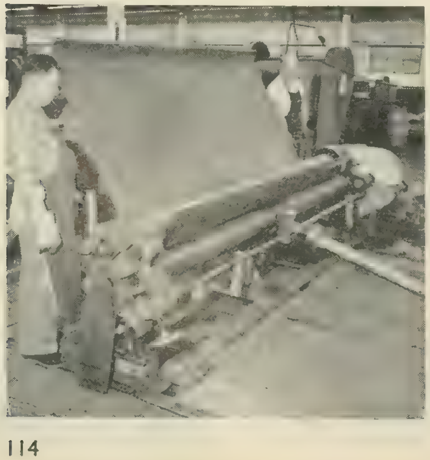
The nozzles are received from the foundry as rough forgings and machined to final shape to maintain the tolerances needed.

GOODYEAR AIRCRAFT'S rocket activities have produced more large rocket motor cases than any other manufacturer. In order to achieve this standing in the industry the company entered the business in 1948 with an extensive development program for an engine case that could be produced economically in quantity. The success of that development program is depicted in accompanying photos of the company's current production facilities.

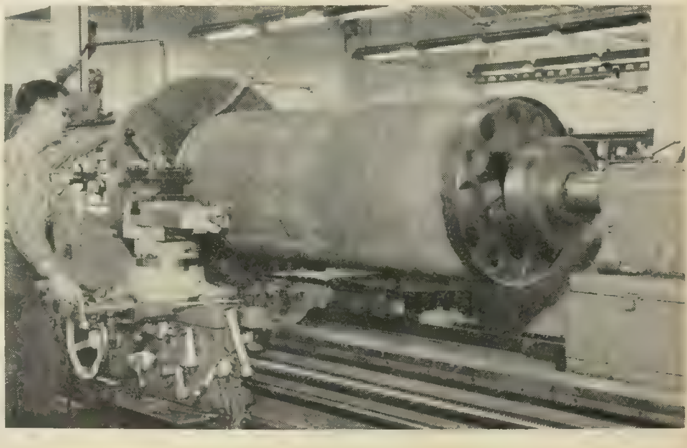
Starting with Jato bottles, Goodyear soon expanded its facilities to produce a large number of units a month for the Army's *Nike-Ajax* missile. *Nike* booster cases are still the chief production item in an expanded program, but the company has built or is building rocket motor cases for the *Nike-Hercules, Matador, Genie, Hawk, Recruit* and other missiles.

Although past and current production has been largely cases made of special steel, extensive investigations have been made into the use of aluminum, fiberglass, magnesium and plastics.★

Steel sheets are rolled into tubes as the first step. Later, tubes are longitudinally welded.



After the longitudinal welding operation is completed, the rough cases are mounted in a lathe and accurately cut to the required length.



Largest Special Metals Company Formed

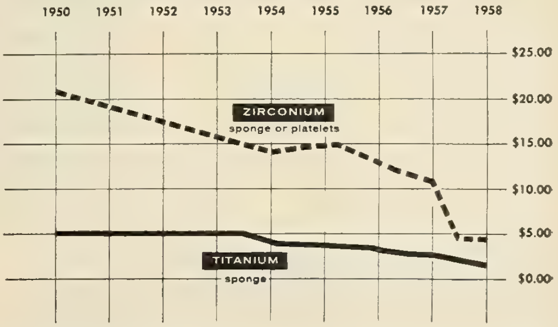
MALLORY-SHARON
NOW INTEGRATED PRODUCER OF
TITANIUM, ZIRCONIUM, SPECIAL METALS

Mallory-Sharon Titanium Corporation has broadened its scope in the special metals field with acquisition of all the titanium and zirconium sponge production facilities of National Distillers & Chemical Corporation, plus full ownership of Reactive Metals, Inc., formerly owned jointly by Mallory-Sharon and National Distillers.

Our new name is Mallory-Sharon Metals Corporation. Our products include titanium, zirconium, and hafnium in sponge form and in a broad range of mill products including sheet, plate, rod, bar, billets, etc. Planned for the future are other special metals.

LOW COST PROCESS—Now a fully integrated producer, Mallory-Sharon will use the new sodium reduction process for making titanium and zirconium sponge. This process is believed to be the lowest cost method developed to date for this purpose, and produces metal of unusually high ductility. It will contribute to making titanium and zirconium economically attractive in more and more applications.

WHAT THIS MEANS TO YOU—Mallory-Sharon's leadership in the special metals field will mean continuing improvements and importance to these metals. In addition to titanium's broad use in aircraft and missiles, and zirconium's in the nuclear field, both metals provide exceptional corrosion resistance—offering lower costs in a broad range of processing and industrial applications. Let us help *you* design ahead with these new metals.



Regular price reductions in titanium and zirconium sponge have also been reflected in lower prices for mill products. This trend shows the wisdom of evaluating titanium and zirconium now for your new products.

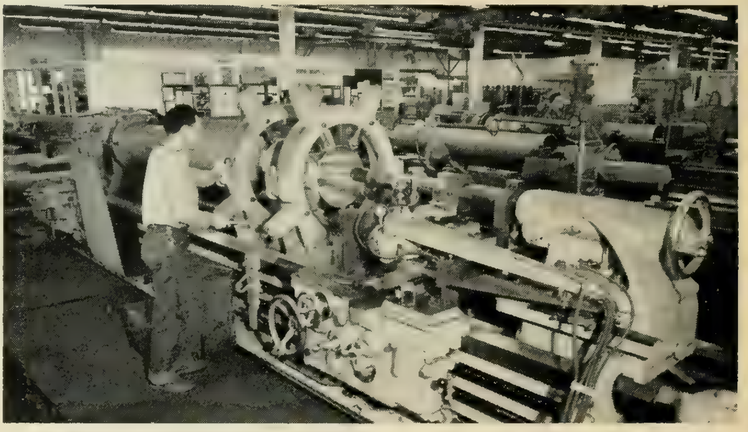
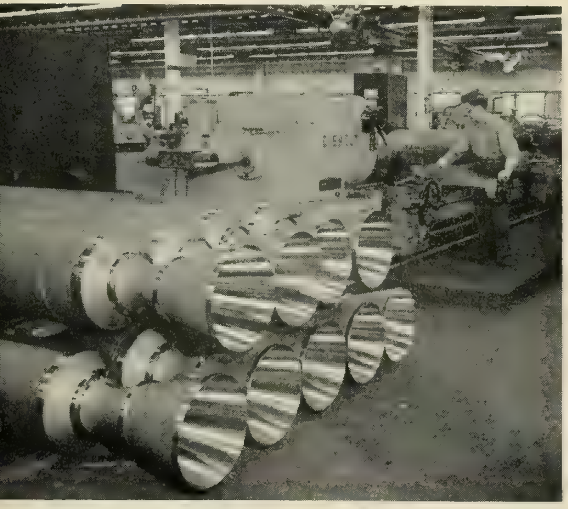
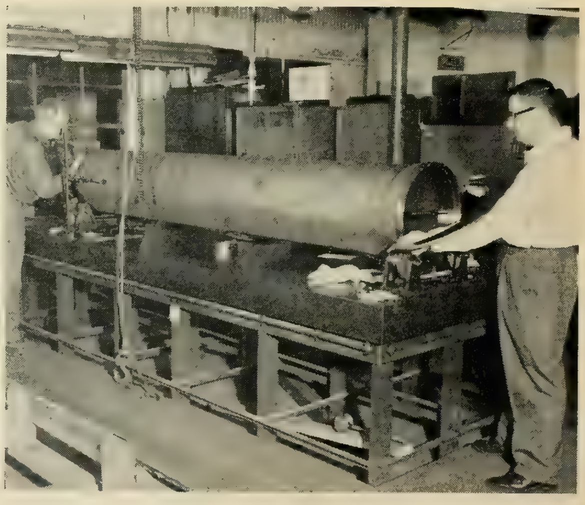
In an assembly fixture, the three principal parts of the motor—nozzle, tube, and forward ring—are welded into a single unit (Above).

Stresses produced by the welding operations are then relieved in a furnace (Above right). To correct any misalignment which may have been caused by welding or heat-treating steps, rockets are given final thrust alignment cuts on a tracer lathe (Right) plus final alignment for fin attachment rings. Rocket motors which have been through operation show bright rings around nozzle (Below).

After machining, inspectors check inside and outside dimensions carefully and alignment of nozzle to case. Past inspection, the rockets are cleaned, bonderized and painted (Below, right).







EEMCO ANNOUNCES

. . . a new electro-mechanical actuator to drive airborne cargo bin conveyor systems

EEMCO electro-mechanical rotary actuator Type D-961 has been developed for use on airplanes to drive their baggage bin conveyor systems. Operated either electrically or manually, the actuator moves the bins forward or aft, and holds the bins in any desired place.

This new **EEMCO** rotary actuator consists of an intermittent duty 200 volt, 3-phase, 400 cycle AC motor and gear box. It is electrically reversible and includes an AC operated brake, thermal overload protection, manual drive input shaft, and reverse torque lock mechanisms.

The unit is designed for normal operating load of 810 in. lbs. torque at 16 rpm, 1.4 amps, and meets all pertinent military specifications. The maximum static load without permanent deformation is 5100 in. lbs.

EEMCO specializes in the design and production of precision-built actuators and motors. The majority of the latest and fastest aircraft and missiles carry one or more **EEMCO** systems. Prime contractors of civil and military aircraft rely on **EEMCO's** years of experience in the exclusive design and production of motors, linear and rotary actuators.

SPECIFICATIONS FOR TYPE D-961

Motor:
200-volt, 3-phase, 400-cycle
AC motor with gear box.

Normal operating load:
810 in. lbs. torque
at 16 rpm, 1.4 amps.

Maximum static load:
5100 in. lbs.

Weight:
12 pounds.

Qualification:
Type D-961 has been designed and qualified to meet applicable military and aircraft manufacturers' specifications.

Your inquiry is invited.

Gaertner Toolmakers' Microscope used to measure typical piece part. Co-ordinate range 4" x 2".

Precise measurement to 0.0001" and 1 min. of arc

Gaertner Toolmakers' Microscope

Here is a reliable, easy-to-use microscope for precise measurement of piece parts, tools, dies, thread gages, templates, jigs, fixtures, etc. Ideally suited for making a wide variety of precision measurements and is especially valuable in reducing rejects in production work.

With the Gaertner Toolmakers' Microscope you make direct, non-destructive measurements — no contact, no distortion, images are sharp and clear. It is a basic measuring instrument for inspection depts., gage labs, tool and die and model shops, industrial and research labs.

The Gaertner Toolmakers' Microscope has been proven in use by U. S. Government Gage Laboratories, and by prime contractors and their subcontractors. With all parties using the same measuring instrument, inspection procedures are co-ordinated and disagreements and rejects minimized.

Features that help you get
HIGH SETTING AND REPEATING ACCURACY

- Low, compact built-in rotary stage reads to 1 minute of arc throughout 360° range.
- Minimum overhang of stages.
- Full 2" precision-lapped lead screws with correction device.
- Straightforward, direct, uncomplicated optical system.

Features that assure you of
EASY, CONVENIENT OPERATION

- Independently rotatable cross hairs in protractor ocular speed up measurements, simplify measuring procedure.
- Convenient location of ocular eyepieces for ease of reading.
- Built-in transformer and plugs for all illuminators.

Modifications and accessories to
MEET YOUR EXACT REQUIREMENTS

- Thread and radius templates, camera and spotting attachments, fine motion focus, variable magnification available.
- If you have a special measuring problem, our staff of representatives will be happy to consult with you. The service and engineering facilities of the manufacturer are always immediately available to help you.

Silicone Applications in the Missile Industry

can polymeric silicon compounds solve today's critical problems?

by Norman L. Baker

ORGANIC COMPOUNDS of the earth's second most abundant element are utilized in many ways to help solve critical problems in the rocket and missile program. Applications range from oils, greases and plastics to heat-resistant lubricants, varnishes, binders and electronic insulators.

A major portion of the missile program is invested in the guidance systems operated and controlled by complex electronic devices. These nerve centers must function perfectly even after storage for extended periods in the humid tropics, in the frozen Arctic or on the salt-sprayed decks of boats or submarines. Silicone rubber and resin coatings, potting compounds and protective shields are providing the answer to these rigorous conditions.

Entire circuits are protected by coatings of silicone rubber. These are moistureproof, fungusproof and impervious to weathering or ozone attacks. These units may be exposed to a temperature range of from −70°F to several thousand degrees within seconds. Even if the silicone rubber covers on the wires and circuits do burn, continuity of the circuits and control of the missile are maintained because silicone rubber leaves a nonconducting silicone residue.

Gaskets, sealing rings and tubing must resist all of the above hazards, as well as function during brief exposure to concentrated peroxides, strong acids and various liquid fuels. These seals must function perfectly even after they have been opened and closed many times during the assembly, testing and preflight periods. Silicone rubber parts are the answer; specifically silicone rubber compounds with the vinyl-containing gums which provide the near ultimate in resistance to taking permanent set.

Silicone fluids with a very high viscosity go into several very ingenious mechanisms such as "grain immobilizers" to compensate for distortion due to temperature in mechanical linkages.

Radome Polyesters

In the structure of aircraft and missiles, silanes and silicones have found important areas of application. Radar transparent radomes are a necessity in all phases of aircraft and missile operation, and glass-fiber-reinforced polyesters are almost universally used for this work. Radar antennas on the ground, as part of the air defense system, are protected by such devices. The units for guiding aircraft and for aiming guns are also covered with radar transparent radomes. An essential ingredient of these products are the vinyl silanes which couple the resin to the glass, thereby increasing the strength and effectively eliminating most of the effects of water or high humidity on both electrical and mechanical properties.

Silicones today are used for the high-altitude, high-speed research rockets and missiles which are being used to secure weather and ballistics information, as well as those which are part of the antiaircraft and antimissile defense.

Guided missile weapons and many other free-flight devices which are electronically guided at very high speeds, as already mentioned, require

New shock tester—the HYGE-6000—available with 12″, 18″, and 37″ long cylinders.

NEW HYGE repeats shock patterns with 40,000 lbf. thrusts

Environmental shock testers now have a method of releasing as much as 40,000 lbf. of stored energy to produce predictable, reliable, and repeatable shock wave patterns.

The new six-inch Hyge produces square, sawtooth, and half-sine patterns to test and set standards for aircraft, missile, turbine, and rocket components as well as other parts subjected to high-*g* acceleration and deceleration.

The procedure . . . You specify the shock wave form you want the Hyge to produce—any of those mentioned above, alone, or in possible combinations.

CEC engineers then calculate your factors of mass, time base, and acceleration level of shock pulse. They design and produce a metering pin which controls the action of the Hyge shock tester precisely.

Hyge tests can simulate almost exactly actual service conditions. The tests are exactly repeatable with very short time lags for set-ups. Unit tests cost only pennies.

Hyge is versatile, small, and requires little maintenance or skill on the part of the operator. The operator does *not* enter the tests as a variable.

Since the whole Hyge principle is relatively new, you'll want more information on the HY-6000 and the smaller 10,000 lbf. Model HY-3000. Write for Bulletin 5-70-A.

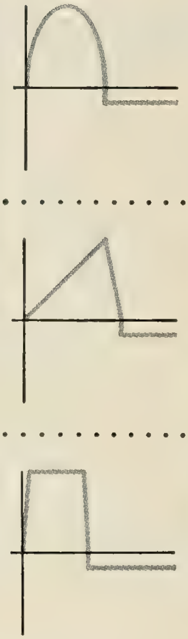
Consolidated Electrodynamics

Rochester Division, Rochester 3, N.Y.

formerly Consolidated Vacuum

SALES AND SERVICE OFFICES IN PRINCIPAL CITIES

Typical shock patterns you can produce repeatedly with the Hyge shock tester



How Hyge works

Differential pressures acting on the upper and lower faces of a piston and seal in an orifice accumulate latent force in the Hyge. This force is released instantaneously when the higher pressure causes an overbalance of upward force to break the seal.

Thrust is transmitted directly through a column to the test platform which rides a braking rail. Pre-selection of metering pins controls the thrust pattern.

Circle No. 141 on Subscriber Service Card.

extensive use of the silicones. Their miniature motors increase operating temperatures—already very high because of the high in-flight ambient temperatures. Silicone rubbers and resins on wires and components, together with supporting silicone laminates and moldings, afford the structural rigidity, dielectric integrity and ultimate in dependability which are necessary under these conditions of severe heat and physical shock.

Silicone Oil Applications

The unusual ability of silicone materials to withstand high and low temperatures and high ozone concentrations also applies to the silicone oils. In addition, the silicone oils offer a range of mechanical properties which suit them for diverse uses.

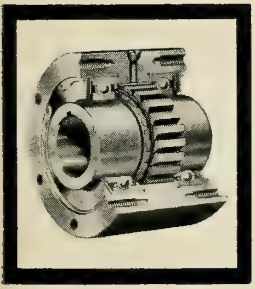
At moderate viscosities the effective liquid range of a silicone fluid, such as L-45 dimethyl silicone oil, is from −40°F to 400°F for short periods. It offers much better resistance to breakdown due to mechanical work than organic oils, and has at the same time very high dielectric strength and corona resistance. Consequently, uses of the silicone oil in missiles and rockets can range from such applications as the fluid in shock absorbers for the *Nike* guided-missile launchers to capacitor fluid material for the electrical systems.

Extensive use of silicone is needed for high-speed missile radomes to overcome the high heat of aerodynamic friction.

The *Nike* shock absorber takes advantage of the long-term stability of the dimethyl oil at all temperatures and its fluidity at low temperatures, which permit the use of the shock absorbers in all climates.

Here and in other applications, the higher compressibility of the silicone oils is used to good advantage. Several hydraulic-system arrangements use the dimethyl fluids because of the good viscosity temperature coefficient.

Electronic systems utilizing fluid-



IS YOUR PRODUCT MODERN IN EVERY WAY EXCEPT ONE?

Take clutches, for example—in aircraft plants throughout the country, modern Formsprag clutches have replaced old-fashioned ratchet and pawl mechanisms as well as their roller-type successors.

This widespread change to Formsprag among designers is, in itself, proof of superiority. Consider, too, Formsprag's other advantages: the patented sprag principle, which allows a Formsprag clutch to deliver more torque per cubic inch of displacement than any other power transmission unit available; ease of installation; and low maintenance cost. An additional feature of its modern design is simplicity, making prototype testing economical.

Remember, too, when it's time to replace your present power transmission—don't *just* replace—modernize with Formsprag. For complete information: send for a copy of the newest Formsprag catalog.

An Invitation To Join ORO . . . Pioneer In Operations Research

Operations Research is a young science, earning recognition rapidly as a significant aid to decision-making. It employs the services of mathematicians, physicists, economists, engineers, political scientists, psychologists, and others working on teams to synthesize all phases of a problem.

At ORO, a civilian and non-governmental organization, you will become one of a team assigned to vital military problems in the area of tactics, strategy, logistics, weapons systems analysis and communications.

No other Operations Research organization has the broad experience of ORO. Founded in 1948 by Dr. Ellis A. Johnson, pioneer of U. S. Opsearch, ORO's research findings have influenced decision-making on the highest military levels.

ORO's professional atmosphere encourages those with initiative and imagination to broaden their scientific capabilities. For example, staff members are taught to "program" their own material for the Univac computer so that they can use its services at any time they so desire.

ORO starting salaries are competitive with those of industry and other private research organizations. Promotions are based solely on merit. The "fringe" benefits offered are ahead of those given by many companies.

The cultural and historical features which attract visitors to Washington, D. C. are but a short drive from the pleasant Bethesda suburb in which ORO is located. Attractive homes and apartments are within walking distance and readily available in all price ranges. Schools are excellent.

filled capacitors are using silicones. The long life of silicone fluid suits it for sealed capacitors, and the fluid's high dielectric strength, excellent insulation resistance and low power factor are as important here as its thermal stability. Surface creepage in electrical systems by moisture absorbed on the surface between contacts is defeated by very thin, baked-on films of dimethyl fluids.

Aerodynamic Heating Protection

The exterior surfaces of many missiles and rockets reach high temperatures because of high-speed flight. The glass-reinforced phenolic exterior parts of these units are rapidly deteriorated in mechanical strength at 500°F or higher. Use of aminopropyltriethoxysilane finishing treatment on the glass permits sustained use at higher temperature or short exposure to temperature extremes which were heretofore impossible.

Here, too, coupling of the resin to glass occurs and is believed to be responsible for the effects. Vinyl silane and amino silane glass finishes make these improvements possible.

More conventional silicone materials available today are a far cry from what they were 10 years ago, and it is well to have a new look at some of the silicone resins and rubber used for electrical insulation.

Silicone impregnating varnishes have the common functions in all Class H systems of sealing, bonding and filling. The degree to which the silicone varnishes perform these functions is much greater today than ever before. For example, R-620 silicone varnish has improved performance for all three functions due to two significant improvements: first, the bond strength of the varnish is retained even though it quickly cures to a hard waxy film; secondly, the varnish is manufactured and supplied in a diluent which allows immersion or vacuum-impregnation of warm units without fear of component breakdown or varnish thickening.

Insulation Improvement

Ground and turn insulation, which has consisted of glass cloth saturated with silicone resins in combination with mica flakes or asbestos, has greatly improved in quality. Uniformity of thickness and retention of dielectric strength at the crease had been major shortcomings of the silicone bonded product, but the new tapes and laminates of today are tough and uniform, and Class H silicone resins have been developed which display better solvent resistance.

Incorporated in glass cloth or

IDEALS AND PRACTICALITY

"Science and Philosophy mutually criticize each other and provide imaginative material for each other."... Alfred North Whitehead.

In the increasing preoccupation of science with material things and progress, the truth of this statement by one of our greatest philosophers is often overlooked and forgotten. The scientific philosopher is a rare being and is becoming rarer still, nor can he be adequately replaced by the group technique or the 'brainstorm' session.

It should be one of the noblest aspirations of all our sciences to provide for the true contemplation of the inner meaning of facts and to stimulate that interplay of mind on mind by which alone we may progress.

In all these things, however, we cannot forget the problems peculiar to research and development in private industry. The obligation to work to otherwise-determined time-scales poses a nice problem in balancing ideals against the practicalities of everyday life.

It is in this field that the test of management comes. Its success at meeting such continuously conflicting requirements determines the character and ultimate success of the organization.

With such thoughts as these in mind, we here at Research and Advanced Development Division of AVCO are seeking unique people. We wish to foster the creative minds and fundamental thinkers, while preserving an atmosphere of self-discipline, free from a rigid hierarchy of command and organization.

No "silicone soft spot" ever gets by at FLEXIBLE TUBING

Silicone rubber will not cure properly if it is contaminated by the slightest bit of moisture, grease or dust. To guard against this danger, Flexible Tubing takes extraordinary precautions in the manufacture of its silicone ducting and special shapes.

All raw materials are scrupulously protected against contamination, and every duct and special shape is built in a special department on automated machinery under automatically controlled temperature and atmospheric conditions. Positive air pressure prevents dust from entering the department even when the doors are open and the personnel all wear sanitized clothing. Each part is serialized and inspected at every stage of production. The result is a top-quality, fully cured product that will behave as it is supposed to against the most rigid aircraft and missile specifications.

So turn to Flexible Tubing for silicone ducting and special shapes. The background and experience of our field engineers are available to you. If you have any problems, let us know. We'll be glad to have a man stop by and talk things over. For full information, write **Dept. 213.**

Represented nationally by Aero Engineering Co. and Airsupply Co., and by Associated Industries in Seattle, Washington.

laminates, R-62 silicone resin offers the added protection of component integrity during subsequent contact with adhesives, varnishes or paints. Very flexible resins such as R-61 retain bond strength in mica glass tapes and laminates when wrapped or formed to their insulation task.

These improvements in inorganic materials and silicone binders, together with application technique improvements on the part of the component manufacturer, have placed effective new insulation material at the disposal of manufacturers of such items as motors, transformers and coils for aircraft, rockets and missiles.

A new silicone resin, especially designed for cold-blending with alkyd, melamine and acrylic-type baking enamels to give them improved color and gloss retention, thermal stability and resistance to weathering, has been developed by Union Carbide. The resin, R-64, is expected to find wide use as a base for aluminum paints to operate in the 500°-1200°F range as protective coatings for engine systems.

A new silicone rubber with exceptionally high conductivity has been developed in the Union Carbide laboratories. This material, K-1516, is compounded with carbon black and has a volume resistivity of less than 10 ohm-cm. Mixtures of this compound with normal silica-filled silicone rubber compounds provide a variety of resistivities. Applied to coils as a tape or from a solvent solution, this material provides an improved corona precipitator. Actually, this rubber is versatile enough to be either a conductor or an insulator, depending on the way it is compounded.

Silicon Rectifiers

All applications outlined here utilize polymeric silicon compounds especially prepared to meet individual demands of the industry. The nonmetallic element is receiving wide usage in its nearly pure form, much of it in the semiconductor field.

Silicon rectifiers offer a most promising range of applications, from extreme cold to high temperature, and from a few watts of output power to very high voltages and currents. Inherent characteristics of silicon allow junction temperatures in the order of 200°C before the material exhibits intrinsic properties. This extends silicon's operating range beyond that of any other efficient semiconductor. The excellent thermal range, coupled with very small size per watt of outpower and extremely high efficiency because of high inverse resistance, make sili-

HONEST JOHN artillery rocket depends on G-E electric heating blanket (inset) to bring missile to uniform operating temperature before launching.

HONEST JOHN FIRING SHOWS HOW . . .

General Electric Specialty Heating Maintains Propellant Temperature

Successful launch—and flight—of the Honest John depends upon exact propellant temperature at the moment of firing. A General Electric heating and insulating blanket—which shrouds missile from nose to nozzle—provides and maintains that temperature!

Proper operation of many types of land and airborne equipment, especially at low temperatures, often depends on controlled heat in the right places at the right time. Experienced G-E heating engineers, backed by complete facilities, have already solved thermal conditioning problems on applications ranging from complete missiles and airborne systems to tiny test instruments.

LET US ANALYZE YOUR HEATING PROBLEM. Whether you need a custom-made prototype, or quantity production, investigate G-E "one stop" service for specialty heating products tailored to your specific needs.

Progress Is Our Most Important Product

GENERAL ELECTRIC

con rectifiers applicable where other semiconductor rectifiers were previously considered impractical.

Silicon, as used in silicon rectifiers, is a nearly perfect single crystal of pure metal to which has been added an element from either group III or group V of the Periodic Table.

Silicon does not readily lend itself to zone refining. Therefore, the most popular method to produce single crystals or pure silicon is crystal "pulling," where a seed of pure single-crystal silicon is dipped into molten silicon, rotated slowly and withdrawn at a predetermined rate. A major problem in crystal "pulling" is to keep the resultant crystal free from contaminants. Molten silicon is very active and attacks the materials used in containers and holders. Quartz crucibles are commonly used and the entire process is conducted in an inert atmosphere to reduce the possibility of contamination. Temperature of plus or minus 0.1°C at approximately 1430°C must be maintained.

When it is determined that the crystal has resulted in the desired type, and that the resistivity is within the range that will produce suitable voltage ratings, the crystal is cut into thin slices and finally into small wafers or dice of desired size and thickness.

After suitable etching and grading to separate wafers that do not conform to established thickness specifications, the dice are alloyed by a special process. Alloying is conducted at high temperatures and provides not only a junction on one side of the wafer but a low ohmic contact on the base. Low resistance contacts are important, since once the internal space charge is overcome the resistance of the cell decreases exponentially and contact and lead resistances become factors limiting current flow.

Alloyed dice are brazed to a base and then hermetically sealed after a contact is provided to the alloyed side. Extreme care must be taken during the mounting and assembly operations to keep the surface free from contamination of any type since contaminants will ionize and shunt the junction.

Final electrical and mechanical tests are performed before and after successive heat cycles to make certain that the rectifier is stable under all conditions of temperature, humidity, altitude and shock.

Silicone chemistry has contributed immeasurably to the sensational development of rockets and missiles. Engineers are looking to silicones to satisfy many of the complex requirements of the missiles of tomorrow.★

...how to prevent heart failure at 1,500 m.p.h.

To perfect supersonic escape techniques, the Coleman Engineering Company has created Hurricane Sam, an amazingly real 6-ft., 180-lb. "man". Internally, a YARDNEY SILVERCEL® Battery—a power pack smaller than a human heart—runs strain gauges, accelerometers and a telemetering transmitter, that measure and transmit his almost-human reactions to a 1,500 m.p.h. catapult from Utah's Hurricane Mesa. Throughout this leap, and many others, Sam's YARDNEY SILVERCEL® heart continues to power vital instruments that will mean survival for human flyers under actual emergency conditions.

HURRICANE SAM'S HEART IS A **YARDNEY SILVERCEL**® BATTERY!

In this dramatic application, where reduced size and weight, and increased power were prime factors, only YARDNEY SILVERCEL® batteries could have been used. Up to 5 times smaller and 6 times lighter than any other battery of equal capacity, it offers the designer of electrical equipment many new opportunities for imaginative application.

There is a wide variety of standard YARDNEY SILVERCEL® batteries for such applications as remote-control work, communications equipment, portable power supplies, telemetering and instrumentation, as well as custom-built batteries for particular requirements.

Write for complete technical data today.

Propulsion Engineering

by Alfred J. Zaehringer

Ion rocket performance measured. Giannini Research Lab reports helium gives an I_{sp} of 600 seconds. Heavier ionization could result in a specific impulse of near 1000 seconds. The measurements were reported at an USAF advanced propulsion symposium held recently in Los Angeles.

•

Hydrocarbons are still king fuels. They are still bigger production items than boron fuels, alcohol, aniline and hydrazine. Yet, hydrocarbon rocket fuels account for only an insignificant portion of U.S. production.

•

Hypervelocity missile launcher. Naval Ordnance Laboratory at White Oak has fired projectiles from a gun using hydrogen-oxygen mixture as a propellant at chamber pressures of 65,000 psi. Small missiles (on the order of 10 grams weight) can hit a velocity of about 15,000 ft./sec. Plugging the barrel results in pressures of 21,300 psi and temperatures of 3710°F. The launcher may be a novel reaction vessel to study new chemical pressures now difficult to attain.

•

Smog-free LOX? Air Products has completed two LOX plants in California for rocket testing. One is a $3-million plant at Boran, Calif. The other is a $4-million facility that serves Aerojet at Sacramento. The latter plant also produces nitrogen.

•

Promising ceramics for nozzles are titanium boride, titanium carbide, zirconium boride and zirconium carbide. The Carborundum Co., working on these materials, reveals that its KT-silicon carbide can take 4260°F in a neutral atmosphere and 2730°F in an oxidizing atmosphere. The material is 96.5 per cent SiC and has 97 per cent of the theoretical density. Unlike other ceramics, KT-SiC acts as its own binder. Its good tensile strength makes it a candidate for rocket nozzles.

•

Impulse loss of control vanes in rocket exhausts. This is slight say Langley Field scientists of NACA who tested both polished SAE 1020 steel and carbon graphite vanes in the 6.25-inch *Deacon* rocket motor. The steel vanes were entirely satisfactory for stabilization. Four vanes pulsed to ±12.5° result in a 3.6 per cent impulse loss. At maximum deflection there is a 4.5 per cent loss and about 3 per cent for zero deflection.

•

New boron advances. Scientists at the University of Michigan have reported work on new, high-energy, highly reactive compounds of boron, nitrogen and phosphorous. Also important is the working arrangement between Thiokol and Callery Chemical to develop HiCal boron solid fuels. Stauffer Chemical and Aerojet-General have joined hands to form Stauffer-Aerojet Co., presumably to work on boron solids.

•

Chemicals for solids. Look to increased markets for the following solid oxidant materials: ammonium nitrate, ammonium perchlorate, lithium nitrate and perchlorate, and diethylene glycol dinitrate. Nitroglycerine and nitrocellulose may also chalk up sales gains. Gaining solid fuel-binders will be the polyesters, polysulfides, epoxy, and synthetic elastomers. Showing R&D gains will be decaborane, polycarbonates, phenolics, vinyls, polyamide and polyurethane.

MISSILE AGE

By Norman L. Baker

Chemical Milling Key to *Thor, Jupiter* Structure

The *Thor* and *Jupiter* IRBMs are fabricated by a new concept in missile structure design, developed to achieve maximum weight saving with an overall increase in body strength. This has been made possible by the use of large integrally stiffened panels chemically milled to the thickness desired.

The United States Chemical Milling Corp., contractor to both ABMA and Douglas, has been milling parts for the *Thor* and *Jupiter* body structures in the form of very large panels. The panels, three feet wide and over 25 feet long, are milled to exact tolerances of ± .003 inch.

Missile designers have long taken full advantage of the weight saving, heat resistance and superior strength made possible by the extensive use of light metals, such as aluminum and titanium. However, machining of these materials, especially titanium, is extremely difficult. But now, through recent advances in the art of chemical milling, further impressive weight saving is made possible. North American Aviation was one of the first companies to utilize chem-milling for the manufacture of small airplane parts during World War II.

Eight of the 3-by-25-foot panels are interlocked to form a cylindrical shell 24 feet in circumference which forms the ballistic missile body. Missile fuel and oxidizer tanks, being cylindrical in shape, fit neatly inside the shell formed by the panels. For some applications, this outside shell actually forms the exterior of the tanks. In other words, the tanks are an integral part of the missile structure. Several bulkhead rings are used to give the shell additional structural rigidity.

The individual panels are extruded and then stretch-formed into an eighth of a circular arc. Locking members on either side and two I-section stiffeners are extruded from the original plate. To allow the metal to flow properly during the extrusion process, a section thicker than required to withstand the stresses is used. Such a heavy panel could not be used for a missile without suffering a large weight penalty.

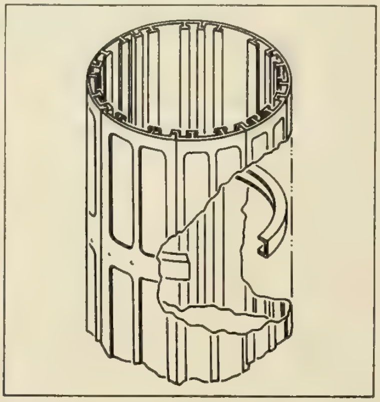
Overall weight reduction was accomplished by chemically milling the entire panel down to a thickness that will carry all loads. Additional design and weight advantages are obtained by providing a taper over the 25-foot length. More than 10 pounds of weight penalty are removed from each panel, resulting in an overall weight reduction of more than 80 pounds.

The bulkhead rings, to which the panels are attached, are first extruded into a channel section, and then chemically milled to remove unnecessary weight after they are rolled into rings. Removal of weight on both parts and the tapering of the panels could not have been done in any other way.

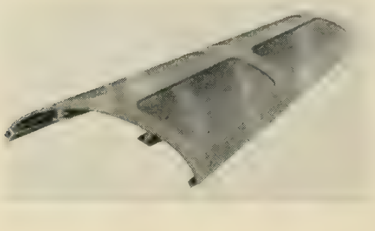
Titanium and supersteel alloys are extremely difficult to form and machine in a conventional manner, and as a result have been greatly limited in their applications. However, it is now possible to produce almost any shape or contour, such as these complicated panels, because of chemical milling.

With a pound of unnecessary weight removed from a missile, approximately 18,000 feet of additional altitude and an extended increase in range can be gained by the ballistic missile. Such gains in missile performance, which have been made possible through chemical milling, are vital in the continuing struggle to improve mass-ratio values.

The list of missile programs utilizing chemically milled components is extensive. The numerous applications of this process have proven that no design is too complex for at least a partial chemically milled operation.



Integrally stiffened panels 3 feet wide and over 25 feet long are chemically milled to exact tolerances of ± .003 inch for fabrication of THOR and JUPITER.



Electric Boat to Build Ballistic Missile Subs

A naval shipyard and one private yard have been selected to construct the three nuclear-powered fleet ballistic missile (FBM) submarines recently approved by Congress in the fiscal 1958 supplemental budget.

The Electric Boat Division, General Dynamics Corp., Groton, Conn., will build two submarines subject to acceptable contract negotiations, and the Mare Island Naval Shipyard will build one.

These two yards were selected because, in the Navy's judgment, these assignments will permit the earliest possible completion date. Rear Adm. A. G. Mumma, USN, chief of the Navy's Bureau of Ships, said that capabilities of other qualified yards will be further considered when additional *Polaris* submarine construction programs are approved.

Orders for reactor compartment components for these three ships, including long lead-time components such as pressure vessels, pumps, steam generators, main turbines, gears and other auxiliary components, are in process.

They will differ from nuclear-powered submarines now under construction chiefly in their missile features, R.Adm. W. F. Raborn has announced. Their hull configuration, similar to that of the USS *Albacore,* will give them high underwater speed. They will be equipped with SINS, the Navy's revolutionary new navigation system, and with new stabilizing and electronics equipment incorporating the most recent engineering advances.

EG&G Under Contract for Nuclear Rockets

An Atomic Energy Commission contract with the firm of Edgerton, Germeshausen & Grier, Inc. will include work on the program aimed at developing nuclear propulsion systems for rockets and missiles.

Under the contract EG&G has been given the responsibility of installing and operating some of the control and measuring systems planned for use in the testing of nuclear reactors which may lead to the development of nuclear rocket propulsion systems. The project is under the direction of the Los Alamos Scientific Laboratory.

Tests will be conducted at the Commission's Nevada test site where EG&G has been responsible for some of the sequence timing, instrumentation and technical photography in all of the tests of nuclear devices conducted there.

DIEHL*

SIZE 11 RESOLVER
REACHES NEW STANDARD
OF ACCURACY

0.03% TOTAL FUNCTIONAL ERROR

Missile guidance today requires more accurate Function Generators, Data Transmitters and Phase Shifters.

The DIEHL Size 11 Resolver is an answer to these problems.

DIEHL engineering and exceptional manufacturing methods insure a *uniformity* of product with a great percentage of the total production well within the 0.03% Total Functional Error. DIEHL defines percentage of Total Functional Error (T.F.E.) as: theoretical sine minus Actual Reading divided by sine 90° multiplied by 100.

A recent statistical check of one standard DIEHL resolver shows:

74% with T.F.E. less than 0.020%
22% with T.F.E. from .... 0.020% to 0.025%
4% with T.F.E. from .... 0.025% to 0.03%

This kind of quality eliminates the risk of culling special units from regular production.

All DIEHL standard units are available within 10 days. We invite your inquiries.

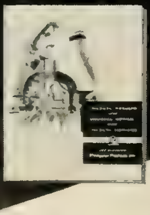
Battery of forging presses up to 4000-ton capacity produces precision parts from unusual metals at the Jet Division.

Our experience includes the precision-forging of thousands of jet engine components, with tolerances as close as ± 0.003".



Write on your company letterhead for Booklet MI-358, which describes the facilities and capabilities of the Jet Division.

Precision forgings with 20-micro finish available for missiles from the Jet Division

Many parts for missile controls, power plants, and structures require the high strength of a forging. Yet complex contours and super-tough alloy structure may make finish-machining slow, costly, and sometimes almost impossible.

This is the place for precision forgings made by the Jet Division. Unusual techniques and precise dies permit production of forged parts with such accurate dimensions and contours that "finish machining" generally means merely a simple polishing operation. Surfaces with 20-micro finish are being produced regularly at the Jet Division.

Alloys now being forged at the Jet Division include stainless and high-alloy steels, Stellite and superalloys, as well as titanium and zirconium.

Our forging engineers will call at your convenience to discuss precision forging applications with your engineers and production men.

OUTSTANDING BOOKS
FOR READERS OF
"MISSILES AND ROCKETS"

GUIDED WEAPONS
By Eric Burgess

Covers the history, theory, functions, future developments and problems connected with guided weapons. Much data is given on specific power plants and missiles as well as discussion of various types of missiles, propulsion and propellants, guidance and telemetery, testing, production, and development.

". . . the most detailed work on missiles to reach the general public . . . recommended particularly for the prospective engineer who is contemplating the missile field and all those in related industries."
—Yale Scientific Magazine

246 pp. $5.00

SATELLITES AND SPACEFLIGHT
By Eric Burgess

A scientific account of the development of earth satellites, including full details on construction, instrumentation, launching procedures, transmission of data and flight orbit. Eric Burgess also includes full information on a space flight program covering the physiological and psychological problems involved in manned rockets and the building of a manned station in space. Expeditions to the moon and the planets are examined in practical, realistic terms.

192 pp. $3.95

ROCKETS AND GUIDED MISSILES
By John Humphries

A comprehensive survey of the present-day achievements and future possibilities of rockets and guided missiles. The author discusses the theory, design, and function of the various types of rockets, including details on the unit and component design of both liquid- and solid-propellant motors. Here is up-to-the-minute information on short-range, long-range, and research missiles and a discussion of the use of nuclear energy in space flight.

Goodyear Boosts Astronautics Division

Goodyear Aircraft, one of the first companies to get into the astronautics field, recently announced that its activities were to be expanded. Studies performed by Goodyear under current military contracts have led the advanced planning for further space orbiting and travel. The company's astronautics section is comprised of a large group of engineers and scientists engaged in studies directly connected with space travel or closely allied with it. Many of these studies bear directly on investigation of the problems of establishing a manned space satellite.

Goodyear astronautics engineers feel that true domination of space does not really start until man has been placed in orbit around the Earth and returned to Earth again safely. From then on, trips to the Moon, Venus, Mars and possibly other planets, are only a matter of time.

Darrell C. Romick, widely known authority on space travel, heads the astronautics section. He has been to Europe to give papers before the International Astronautical Federation and has talked before scientific and engineering groups in all parts of this country since the early 1950s. As a member of the American Rocket Society, Romick was one of the scientists who recently sent their space flight recommendations to the White House.

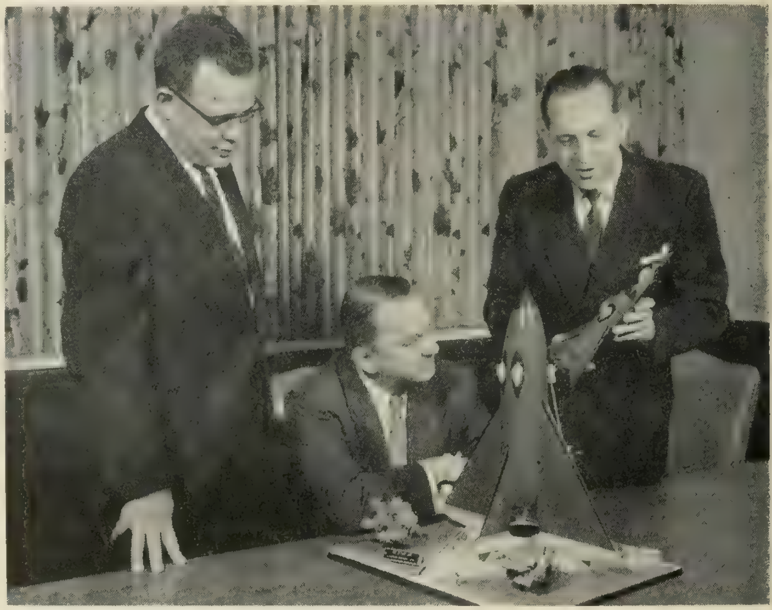
From the studies made by Romick and several other engineers, notably Richard E. Knight and Samuel Black, there has evolved a concept for a three-stage rocket to get man into orbit and bring him back, with this difference—the two booster stages would be also manned and recoverable for reuse.

The concept is called *Meteor* and a smaller version, less costly and which can be put into operational status within six to eight years, is called *Meteor, Jr.*

In the *Meteor* concept, Romick visualizes three delta-wing aircraft taking off vertically and nested tail in nose, the first booster separating from the group at about 35 miles altitude and returning to Earth in a ballistic-hypersonic glide.

On making a conventional landing, the booster is fitted with jet engine pods and fairing, and makes a conventional airplane-type flight back to the original launch site. The same thing occurs with the second stage, except that, due to higher altitude and greater speed at separation, it would land at a more distant point from the launch site. The third stage would likewise be capable of making an unpowered glide back to Earth.

The astronautics section has worked out not only the requirements for the rocket vehicle itself in considerable detail, but have made advanced studies of necessary ground-



Thomas A. Knowles (seated), president of Goodyear Aircraft Corp., is briefed on the company's space flight program by Darrell C. Romick, head of the astronautics section. E. A. Brittenham, chief engineer, is at left. Romick is holding model of the METEOR, JR.

MISSILE MARKET GUIDE is an EXTRA Mid-April issue of MISSILES AND ROCKETS

It will offer the first complete, classified listing of all manufacturers serving the missile market under 10 major heads and over a thousand sub-heads. All listings are free. Major breakdowns include such categories as MISSILE FRAME MANUFACTURERS, PROPULSION SYSTEMS, GROUND SUPPORT EQUIPMENT, GUIDANCE EQUIPMENT, TRACKING AND TELEMETERING EQUIPMENT, ETC. In addition to the classified section, there will be a missile catalog listing all of the different items going into a missile . . . an alphabetical list of all manufacturers of missile components, electronic equipment, hardware, etc. . . . a list by company of the people who specify and buy missile equipment . . . and many other features of interest.

Place your advertising in your category . . . where it will be seen year round by prospects searching for what you have to sell.

For additional information, contact the MISSILES AND ROCKETS Regional Advertising Manager nearest to you.

handling equipment. The permanent earth satellite has been extensively studied and provision has been made to house technicians and scientists while the vehicle speeds around the Earth at 16,500 mph. There will be laboratories, living quarters and as many other of the normal conveniences of Earth-life as possible.

Goodyear has emphasized that even though a system such as *Meteor* would be costly to develop and take time to get into operating status, figures show that economies inherent in the concept make it an attractive way to approach the problem.

Engineers Sought by Boeing Airplane Co.

Boeing Airplane Co. currently is seeking several hundred engineers for work in all Seattle-area divisions, it has been announced by Stan Little, employment administrator.

Boeing is particularly interested in hiring engineers with advanced degrees and those with electronics background, he said. Many of the new engineers will be assigned to the pilotless aircraft division, where work is under way to accelerate the pace of *Bomarc* IM-99.

Engineers also are needed to step up developments in other divisions.

New X-ray Developed to Inspect Solids

A new high-voltage X-ray generator for detection of flaws in solid rocket and missile fuel charges has been developed jointly by High Voltage Engineering Corp., Thiokol Chemical Corp. and the Friez Instrument Division of Bendix Aviation Corp.

Internal cavities, cracks, fissures or bits of foreign material can affect performance of the missile since there is a critical predetermined balance ratio between the missile charge and the centerline of the missile proper. In actual operation, as the combustion line advances along the propellant charge surface, hidden pockets or cavities can result in uneven burning, conceivably affecting the forward thrust of the missile and altering its course or possibly burning a hole out the side, destroying the missile itself.

Inspection of solid propellants heretofore has been a costly, cumbersome process. Radiographic film is wrapped around the outer surface of the missile or arranged in a flat plane. X-rays are passed diametrically through the fuel, with resultant exposure of film.

Limitations of this technique are due to the high loss of intensity incurred by the X-rays as they pass through the entire thickness of the missile before exposing the film. Engineers concluded that if a small and powerful enough radiographic generating unit could be developed, it might be lowered into the hollow core of the fuel, cutting penetration requirements by 50 per cent.

Thiokol contacted High Voltage on design of a special Van de Graaff X-ray generator for this particular application. High Voltage engineers devised a special 10-foot electron-tube extension for one of their standard supervoltage machines, which would slip down into the propellant core. High energy X-rays are generated from the tip of the tube to concentrate intensity in one direction at a relatively acute angle.

Engineers at Thiokol then moved forward on development of a handling system. This system consists of a rotating base or platform where the fuel charge is placed on end. This platform also has a vertical range of movement equal to half the length of the longest fuel castings.

A Lumicon viewer, manufactured by the Friez Instrument Division of Bendix Aviation Corp., is mounted in a fixed position to one side, with the 10-foot extension of the Van de Graaff generator coming down in a fixed position through the ceiling. The accelerator itself is mounted in a room above.

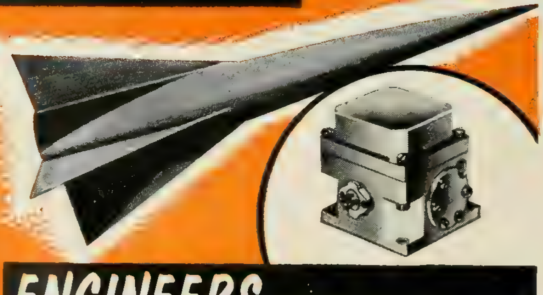
Method of operation consists essentially of rotating and raising the fuel charge, spiral-fashion, about the X-ray source. The charge is raised a few inches during each revolution. Thus the fixed X-ray source, monitored on the Lumicon receiver outside, provides a continuous radiographic picture covering the entire volume of the fuel charge.

Directors and Officers Named by Astrodyne

Officers and directors to head Astrodyne, Inc., have been named following incorporation of the company to specialize in solid-propellant activitie in Delaware.

Officers of the new corporation include: president, J. L. Atwood, who i president of North American; vice president, R. W. Thomas, who is Phillip vice president for research and development; treasurer, R. A. Lambeth, who is North American's vice president finance and its treasurer; and secretary Paul J. Parker, who is secretary and assistant treasurer of Phillips.

Eight officials of the two founding companies were elected as director



PESCO . . . and MISSILES!

The development of each new and more powerful Missile depends upon its Components for top performance. PESCO is first with Specialized Power Sources, Permanent Magnet Alternators and Secondary Power Systems.

LOOK...NO WELD!

Hawk motor tube deep-drawn in one piece from AISI 4130 steel blank.

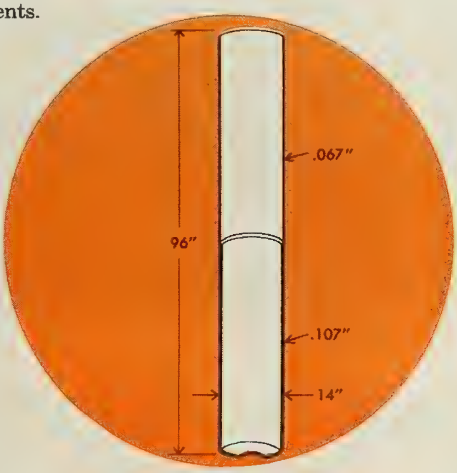
Large missile motors deep-drawn in one piece by NORRIS-THERMADOR

Norris-Thermador, largest U.S. manufacturer of steel and brass cartridge cases, has developed advanced techniques for the deep-drawing of large rocket and missile motors in one piece. Formerly, such large cylinders could be fabricated only as welded assemblies of two or more parts.

Here are the advantages of the deep-drawn motor tube as compared to the multi-piece or wrap-up-and-weld methods of fabrication:

- ★ *Increased Dependability*
- ★ *Greater Structural Strength*
- ★ *Closer As-Formed Tolerances*
- ★ *Lower Material and Production Costs*

This advancement in production of missile motors offers new opportunities to simplify the design and improve performance characteristics. Let Norris-Thermador engineers evaluate your design requirements.



Write for brochure GP-1 which illustrates and describes the Norris-Thermador development and production facilities.

HELI-COIL® INSERTS...
PART OF AMERICA'S
SUPERSONIC
"SUNDAY PUNCH"!

Heli-Coil Screw-THREAD and Screw-LOCK Inserts are used throughout Convair's B-58 "Hustler". They help combine lightness with exceptional strength and rigidity in the power plant, fuselage, wings, control surfaces and electronic equipment. This adds up to rock-solid structural security for the nation's newest and fastest bomber.

HELI-COIL Screw-THREAD Insert . . . provides stainless steel threads that permanently resist wear, corrosion, stripping, galling and seizing . . . hold fast under vibration and shock. Conforms to military standards and all standard commercial and industrial thread forms.

HELI-COIL Screw-LOCK* Insert . . . new one-piece design provides all the advantages of the Screw-THREAD Insert *plus* an exclusive internally integrated locking feature that eliminates need for lock-nuts and lock-wiring . . . permits repeated disassembly and reassembly with locking action remaining unimpaired. Meets military specifications for locking torque and vibration.

of Astrodyne. From North American, they were J. L. Atwood, R. A. Lambeth, J. S. Smithson, vice president-administration; and S. K. Hoffman, vice president and general manager of North American's Rocketdyne division.

Phillips officials elected as directors of the new company were: Paul Endacott, president; Stanley Learned, chairman of the executive committee and assistant to the president; W. W. Keeler, executive vice president.

The new company will have its headquarters and operations at Air Force Plant 66 near McGregor in central Texas where Phillips has conducted solid-propellant research and development for the Air Force since 1952 and currently employs about 900 people. Phillips employees at Air Force Plant 66 and some of North American's personnel will transfer to the new company.

Astrodyne officials explained that within a few weeks contracts and operations for the government at Air Force Plant 66 would be transferred to Astrodyne subject to Air Force approval of the company's proposal.

Col. John Paul Stapp, renowned authority on aviation medicine, holds a chunk of the solid rocket fuel, developed by Phillips Petroleum Co. The fuel powered the huge "Megaboom" rocket motor built by Phillips. This new motor accelerated a rocket sled to 1337 miles per hour in a few seconds. At the instant of peak speed, it was producing about 112,000 lbs. thrust.

Girdler Building Callery Hydrogen Plant

A $3.4-million contract to design and build hydrogen, nitrogen and carbon dioxide producing and purifying units for Callery Chemical's high-energy fuel plant has been awarded to the Girdler Construction Division of National Cylinder Gas Co.

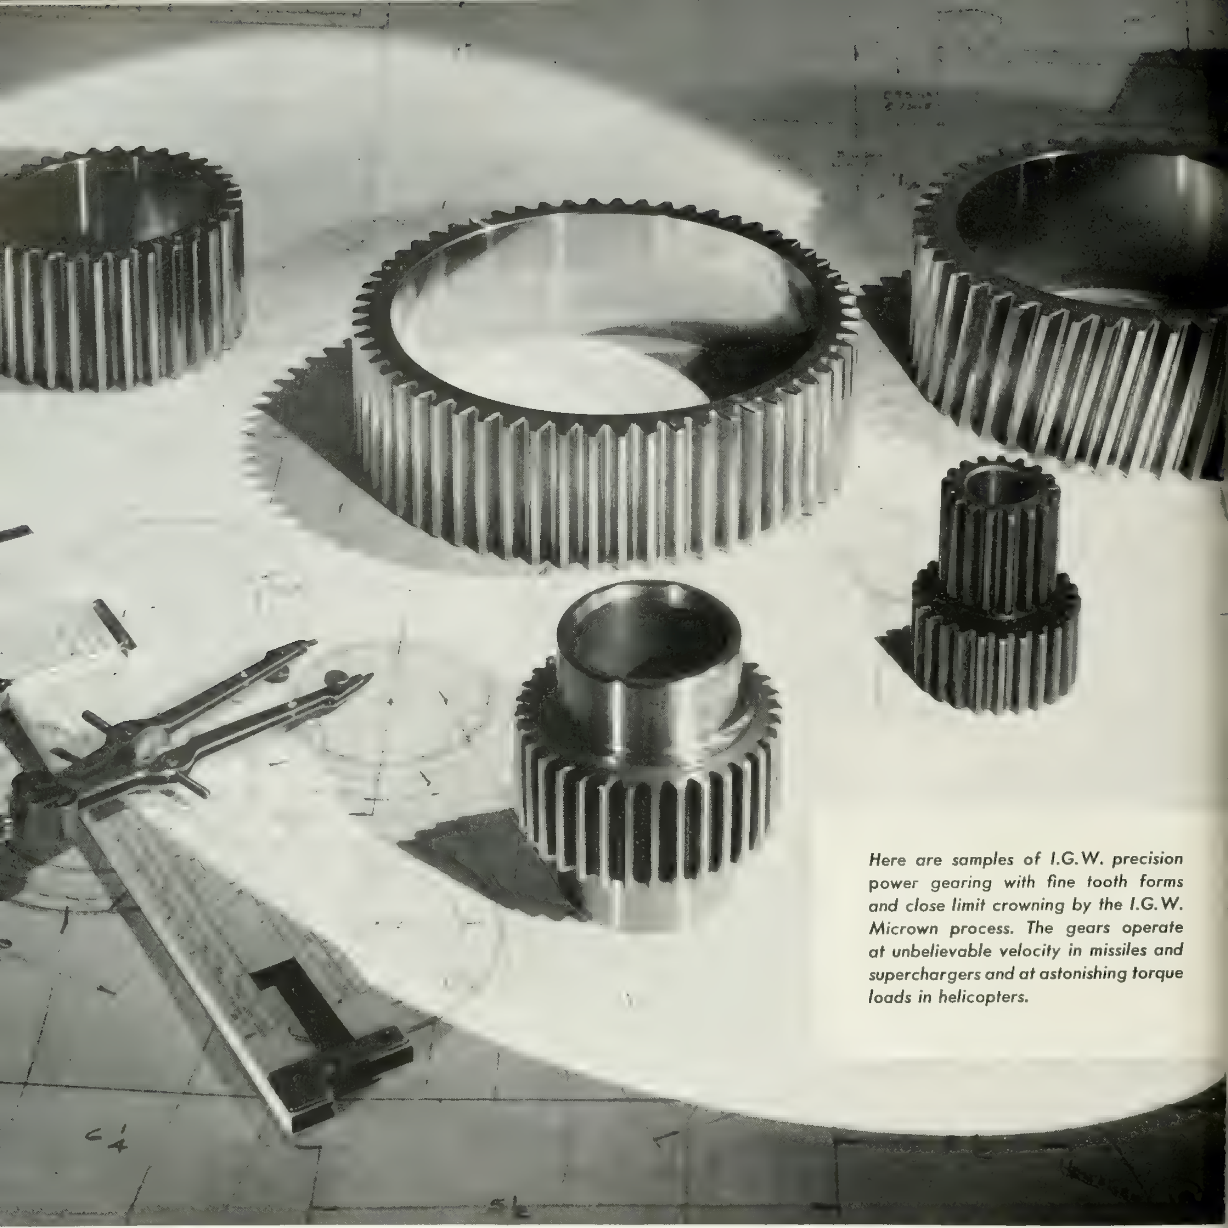
Checking the lead of the internal gear used in the second stage of the Sikorsky S-58 Helicopter. Permissible lead error is only .0003 in. of face. This gear is finish cut at 50 Rockwell C. It's actually much harder than a good penknife blade.

Precision is our only product!

● The aeronautical age has given the word precision new scope. Tolerances have shrunk farther past the decimal point. Stresses and strengths have new dimensions. Yet, whatever the specifications are, I.G.W. still has just one product—precision.

IGW

INDIANA GEAR WORKS, INC.
INDIANAPOLIS 7, INDIANA



Here are samples of I.G.W. precision power gearing with fine tooth forms and close limit crowning by the I.G.W. Micrown process. The gears operate at unbelievable velocity in missiles and superchargers and at astonishing torque loads in helicopters.

missile precision

is our kind of precision

● Exacting tolerances—tight schedules—they're all in a day's work at I.G.W. Day after day, year after year, our experience in the missile and aircraft field enables us to put teeth in the word precision—and precision into teeth.

IGW

INDIANA GEAR WORKS, INC.
INDIANAPOLIS 7, INDIANA

now under construction at Muskogee, Okla., announced that Girdler Construction will furnish all engineering, apparatus, material and complete field construction and start-up services for the high-purity industrial gas plants. The Muskogee plant, scheduled for completion at the end of 1958, will produce tonnage quantities of the high-energy boron fuel for powering jet aircraft and missiles.

The subcontract includes a plant to produce hydrogen as raw material to be chemically processed for its end role in the high-energy fuel molecule. Additional Girdler plants on the Muskogee site will produce nitrogen, an inert gas to be used as a protective atmosphere in various processing steps, and carbon dioxide. Storage units for hydrogen and nitrogen are included in the contract. Completion of the Girdler units is scheduled for late summer. Specialty catalysts for the hydrogen plant operation will be produced by the Girdler catalyst plant in Louisville.

$2-Million Expansion Set for Martin-Denver

A new two-story structure, totaling 115,000 square feet, is to be added to the factory at the Martin-Denver facility at a cost of approximately $2 million.

A $125-thousand contract has been awarded to Connell, Pierce, Garland & Friedman, Miami, Fla., for planning and designing the new building. The Miami firm recently completed the new Martin-Orlando plant, one of the largest industrial installations in Florida.

Preliminary plans for the Denver project will be started immediately, with construction to begin on June 1 and completion due by January 31, 1959. When occupied, the new factory addition will eliminate storage and warehouse operations now located in Denver.

First ICBM Squadrons to be Activated April 1

The first two intercontinental ballistic missile squadrons will be activated at Camp Cooke, Calif., on April 1. The Air Force announced that the two are: the 576th Strategic Air Command Intercontinental Ballistic Missile Squadron and the 393rd ICBM Training Squadron.

The 393rd Training Squadron will be responsible for the training of the 576th and later squadrons. The 576th Squadron will move to Francis E. Warren AFB, Wyo., after completion of training. Commanders for the groups have not been announced.

Brooklyn Polytech Gets Rocket Research Grant

Polytechnic Institute of Brooklyn will conduct a year-long study of combustion instability and scaling-up of rocket motors using liquid propellants under a grant of $50,000 awarded by the Air Force Office of Scientific Research.

Largely concerned with analytic formulations, the contract also calls for experimental work entailing an exhaustive study of fuel injection units under a wide range of conditions. For this phase of the research two combustion chambers have been constructed in Polytechnic's rocketry laboratory.

The contract is under the direction of Dr. T. Paul Torda, professor of mechanical engineering. Dr. Torda's work on liquid-fuel rocket motors dates back to World War II when, as a graduate student at Polytechnic, he worked with a 15-man team on the study of various problems connected with the first Navy jet aircraft. A native of Budapest, he joined the faculty of the University of Illinois in 1949 after receiving his doctorate at Brooklyn Poly. In 1955 he returned to Polytechnic as a full professor.

STRENGTH
ACCURACY
DEPENDABILITY

HUCK AIRCRAFT FASTENERS

HUCK CKL Fasteners have played an important part in the development of America's faster-than-sound airborne craft.

Their many unique features offer maximum dependable strength at minimum installed cost, plus:

- High strength to weight ratio.
- Positive mechanical lock.
- Excellent sheet pull-together.
- High shear and tensile strength.
- Absolute sealing quality.
- Simple visual inspection.

There is a HUCK fastener to meet your requirements. Our specialized fastener experience is at your service.

contract report

Trends

The volume of contracts being let by the Government has now returned to a somewhat normal pace. However, money for performing on these contracts has still not been released. This is because of an astounding amount of confusion in Washington, added to the "conventional" volume of red tape. One reason for the hold-back on money is the fact that there is still not a space-flight program in Washington—four months after *Sputnik*. Nobody has the courage to make a decision.

$ $ $ $

Write and ask for a copy of House bill H.R. 8002 which would return Government accounting to an accrued expenditure accounting system. It could mean some drastic changes in how you plan ahead. If you've got objections, write them in to your Congressman.

$ $ $ $

The right of the Government to unlimited use of technical data developed by Government contractors is under dispute again. Contractors interested in gaining greater protection for their commercial "rights" and interests should make themselves heard.

$ $ $ $

Three new revisions of the Armed Services Procurement Regulations have been made public—Revision No. 27, dated January 2, effective April 2; No. 28, dated January 28, effective April 28; No. 29, dated February 5, effective May 5. These cover unacceptable bids, patent rights and mistakes in bids, and bid-form preparation. All are available from the Superintendent of Documents, Washington 25, D.C.

$ $ $ $

Air Force is using a new contract clause which limits reimbursements made to contractors. It reads: "Notwithstanding any other provision of this contract, the Government shall not be obligated to reimburse the contractor, for work performed under this contract, any sum which is in excess of the cumulative amounts indicated for each period specified in the following Schedule of Reimbursement." It doesn't limit the final amount which you get under a contract, but it does limit how much is paid in the form of progress payments.

$ $ $ $

Don't go running to ARPA (Advanced Research Projects Agency) for business. It will be three months at a minimum before the new Defense Department agency really has an idea of what it's supposed to do. Even then, most of the funds over which it has control will be allocated for research rather than production projects.

$ $ $ $

If it's any help for your morale, Defense Secretary McElroy says that missiles will get 24 cents out of every procurement dollar in fiscal year 1959, when share for manned aircraft drops to 50 cents.

$ $ $ $

This is a period of flux. Congress is still trying to find out just what has been and is going on. The Executive seems even more in the dark. In a word, everyone is waiting for everyone else to make their minds up so that they can go along with the crowd. This will all sort itself out in a fairly short time. Meanwhile, any selling you do now will pay real hard cash dividends later when definitive programs get under way. The pressure to do something—to get on with it—is building up to a point where even bureaucratic Washington will be unable to resist it. The chips are still down despite the success with *Explorer*.

Awards

For nuclear warhead test equipment: Nuclear Instruments Division of Telecomputing Corp. has been awarded a $1,000,753 addition to existing Army Ordnance contracts.

For service test of liquid rocket engines: Reaction Motors, Inc., has received a $3,027,266 contract from Air Materiel Command.

Nuclear Rocket: Rocketdyne Division of North American is working on nuclear rockets under contracts administered by the Wright Air Development Command in coordination with the Atomic Energy Commission.

RAT: Allegany Ballistic Laboratory has received contracts to build the rockets for Navy's new rocket-launched torpedo. **Librascope, Inc.,** has the guidance contract.

Re-entry: Aeronutronic Systems Division of Ford has received an Air Force contract to study gas interactions of ICBM nose cones upon atmospheric re-entry.

Hawk: Raytheon Manufacturing Co. has received a $13,249,594 contract for procurement of *Hawk* missiles and components; includes an estimated 20% of subcontracting for missiles and supporting ground equipment.

Falcon: Hughes Aircraft has received a $19,278,275 contract for GAR and GAR-3 rockets. Hughes has also received a $21,188,717 contract for interceptor aircraft and weapon control systems.

Logistical planning: Planning Research Corp. has received a $234,000 contract for a detail study of requirements for logistic support of the Army during 1960-70.

Bell Aircraft has received two subcontracts for work in its Avionics and Rocket divisions, but cannot reveal details due to security.

Countermeasures: Hoffman Electronics Corp. has received an $11-million Air Force contract to develop the electronic reconnaissance system known as Tall Tom (AN/ALD-3). Subcontractors include **Cornell Aeronautical Laboratory, Inc.; Filtron Co., Inc.; Lockheed Aircraft Services, Inc.; Olympic Radio and Television, Division of Siegler Corp.; Radiation, Inc.; Sanders Associates, Inc.;** and **Stanford Research Institute.**

Additional missile contracts placed during the month include: **Radiation, Inc.,** $230,000 for increase in funds . . . **Potter Instrument Co.,** $50,000 for increase in funds . . . **Westvaco Chlor-Alkali Div. of Food Machinery & Chemical Corp.,** $38,157 for rocket propellant.

This new Airborne modular actuator—rated 20 lb./in. at 26 v d-c—is not a standard model in the usual sense. Rather, it is merely one example of the many different rotary actuator packages that can be assembled from Airborne's new line of standardized, interchangeable actuator components.

AIRBORNE now offers you the advantages of modular design in rotary actuators, too

A year ago Airborne introduced a new line of linear actuators based on the modular design concept. Because of the excellent reception accorded it, we are now offering the advantages of modular design in Airborne rotary actuators as well.

With modular design, you are no longer limited to a line of a few standard models whose design is relatively fixed. Instead you can now specify any one of several dozen different actuator packages assembled from standardized, interchangeable Airborne components. In most cases, this will give you a rotary actuator that exactly meets your capacity and configuration requirements. As a result, you have greater design freedom without becoming involved in the expense and delay associated with specials.

In addition, while redesigning under the modular system, we have reduced the bulk and increased the capacity of many Airborne actuator components. You get more power in a smaller package, one that saves valuable weight and airframe space.

Write today for further information on Airborne's new modular-design actuators—rotary or linear.

Need control consoles?

GENERAL ELECTRIC came to IEC

General Electric Company, Aircraft Gas Turbine Division, came to Industrial Engineering Corporation for the construction of this Master Control Console for the Engine Simulator, which was developed by General Electric for the United States Air Force.

If your problem is functional test equipment or control panels, Industrial Engineering Corporation can supply the answer. Whether your needs call for the use of hydraulic, pneumatic, electric or electronic principles — singly or in any combination — IEC has the imagination, the know-how, the facilities to handle the job *right*, from original design to actual installation.

Consult IEC on *your* test equipment requirements. Write today!

Magnetics May Aid Return of Satellites

The new science of magneto-aerodynamics may provide the means for the safe return of artificial satellites to the earth's surface, according to an advance summary of research results in this field. Dr. William R. Sears, director of the Graduate School of Engineering at Cornell University, in a lecture at the National Academy of Sciences declared that further research in this field may also lead to a tremendous increase in the thrust of conventional rocket motors.

Magneto-aerodynamics is concerned with the partial ionization of air that occurs when objects pass through it at extremely high speeds, notably during the re-entry of rockets and satellites into the earth's atmosphere. As friction and compression heat the air in front of the object to very high temperatures, the atoms of which air is composed release free electrons and the air then becomes a conductor of electricity.

According to research at Cornell, this conductivity can be further increased by "seeding" the air near such a high-speed body with a small amount of an easily ionizable substance such as sodium or potassium. At speeds of Mach 12 to 14, a state of conductivity several times greater than salt water can thus be induced.

"If this technique can be worked out, and if magnetic field strengths comparable to those of permanent magnets can be provided in flight," said Dr. Sears, "electric currents will be set up by the motion of the air, and significant forces can be applied directly to the airstream."

In the case of a satellite re-entering the atmosphere at high speed, the electromagnetic relationships will resemble those of an electric generator. The hot, seeded air, being a conductor of electricity, takes the place of the windings of the generator armature, while the magnetic field emanating from the satellite in flight will supplant the generator's fixed field. As the satellite plunges back into the atmosphere, the moving of this hot-air "armature" across the magnetic field of the satellite will generate an electric current.

Just as torque tends to retard the armature of an operating generator, so will the air flowing past the missile tend to be decelerated. "This retarding effect," said Dr. Sears, "may prove useful in slowing down satellites to prevent their overheating as they enter the atmosphere."

Aerojet Will Add 1000 Employees by June

Aerojet-General Corp. expects to add 1000 professional and skilled workers at its Sacramento plants by June. The company currently employs about 7000 people in the Sacramento facilities where work is in progress on rocket engines for the *Titan* and *Polaris* ballistic missiles.

Mr. R. H. Stevens, manager of industrial relations, emphasized that almost all of the new openings will require professional engineers or highly skilled tradesmen. He said there will be very few jobs for untrained workers.

Mr. H. R. Todd, head of engineering placement, estimated that about one-fourth of the 1000 additional personnel will fall in the professional or college-trained class.

"We need 500 top-level scientific personnel to work in many fields including mechanical, aeronautical, electronics and chemical engineering. They will engage in research and development work on the world's most advanced rocket propulsion systems," Todd said.

Britain Developing Advanced IRBM

A White Paper on Defense released by the British Information Services disclosed the development of a British IRBM of more advanced design than the *Jupiter* or *Thor* that will be launched from "hard" bases underground. The British IRBM is reported unofficially to have a range of 2500 miles.

The announcement stated that the agreement for supplying Britain with intermediate-range ballistic missiles will be completed and published shortly.

In discussing the Russian military position and the contribution the Free World must make to offset the Russian threat the government said:

"Peace is being maintained by a balance of arms. The ultimate aim, however, must be comprehensive disarmament by all nations coupled with comprehensive inspection and control by a world authority. The West is ready to discuss proposals of all kinds with Russia, and with sincerity and perseverance agreement should not be impossible, but negotiations are bound to be protracted. Meanwhile the Free World cannot afford to lower its guard.

"Though Russia has been making great strides in the field of nuclear weapons and rockets her basic strength lies in her superiority in conventional forces; the West relies primarily upon the nuclear deterrent. Russia's successful launching of satellites has not upset the balance of military power; in fact, the overall superiority of the West is liable to increase as a consequence of the introduction of medium-range ballistic rockets.

"The protection of the Free World must be undertaken by a collective effort. Britain will continue to make her main contribution to peace through NATO, the Baghdad Pact and SEATO. An increasing degree of interdependence must be accepted.

"The frontiers of the Free World

6000 cps

—a new high in frequency from a high force vibration exciter system

With new 6000 cps rating, the MB Model C10VB electrodynamic exciter further extends the complex motion testing range . . . yet delivers 1750 pounds force for sinusoidal testing with an MB Model T666 15 KVA amplifier (36,000 watt plate dissipation).

This is versatile equipment. With an MB T666 amplifier and TEMC control cabinet, it has the "muscle" to subject electronic products and other critical components to accelerations up to 58 "g". Adding an MB T88 Complex Motion Console equips it for duplicating the actual "noise" or random motion of the environment. This system is designed with an eye to future needs.

What's more, the exciter works in environmental test chambers, so that vibration can be combined with heat, cold, altitude. This not only saves test time, but gives more realistic data on performance as well.

MB C10VB Exciters have UNIMODE rocker suspension (pat. pend.) which assures linear motion and a uniform spring rate over the total stroke of 1-inch (double amplitude).

Users of MB test equipment have at their call a nationwide field service organization of vibration specialists to help on application problems. Send for full data on the complete line MB Shakers.

must be resolutely defended on the ground. The three regional defense organizations together provide this vitally necessary defensive shield, the effectiveness of which, however, depends ultimately on the fact that behind them stands the immense nuclear power of the West to which Britain is making an increasingly significant contribution, British megaton bombs are in production and deliveries to the RAF have begun.

"Progress is being made with the development of a propelled bomb. The role of Fighter Command is now limited to that of protecting the bomber bases. When the Russians can knock out our airfields with rockets, the value of fighter defense will decrease. But that point has not yet been reached."

Southwest Research Designs *Thor* Shelter

Prototypes of the launching complex shelter for *Thor* missiles are now being built by the missile engineering division of the Douglas Aircraft Company, Inc. from designs furnished by the architectural staff of Southwest Research Institute.

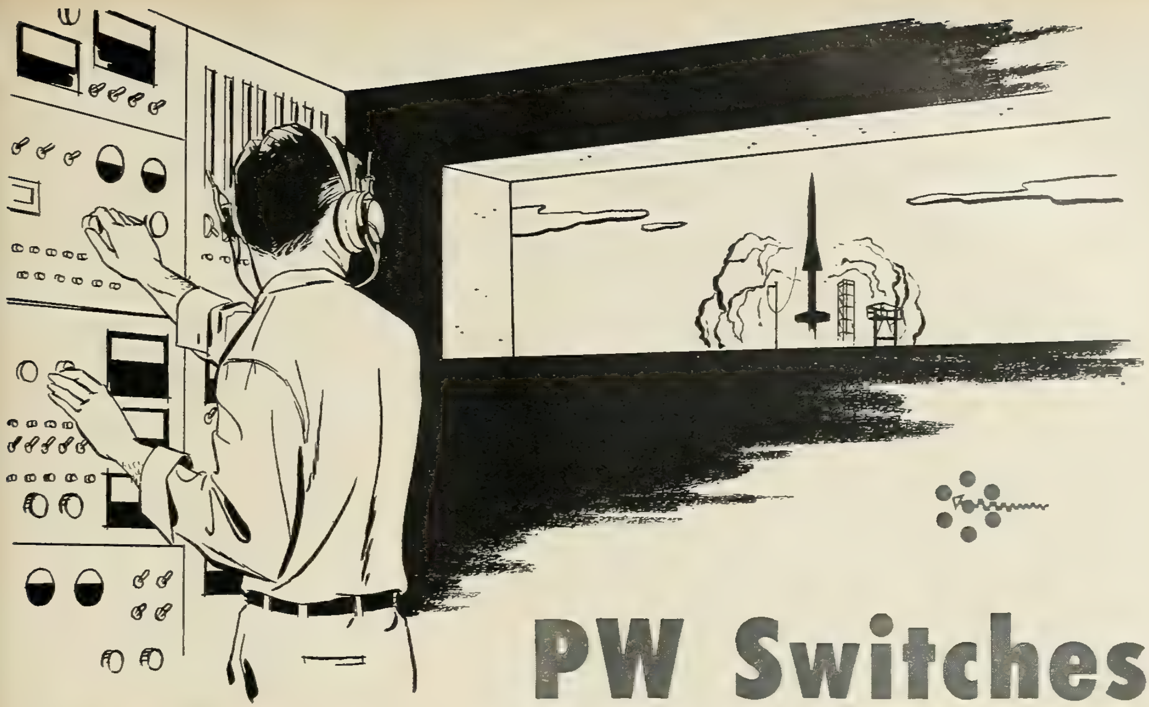
The unit is designed for sheltering the missile in either extreme heat, cold or other varying environmental conditions. The demountable structure is designed to be flown to its location with its largest component being 8 by 15 feet. It will withstand winds up to 120 miles per hour.

The shelter will cover the launching pad and the missile in a horizontal attitude to permit suitable maintenance and firing check-out operations. The front doors slide horizontally on a manual basis. The main shelter then moves over the missile by remote control. The missile is then erected on the pad by a hydraulic lift.

NACA Space Committee Holds First Meeting

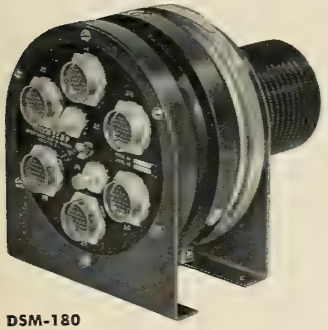
The special committee on space technology of the National Advisory Committee for Aeronautics held its organization meeting in February at NACA committee headquarters, in Washington, D.C. The full 15-man membership headed by Dr. H. Guyford Stever attended. Also participating in the meeting were NACA Chairman James H. Doolittle and Dr. Hugh L. Dryden, director of the NACA.

Working groups to deal with specific aspects of space technology were set up yesterday. They and their chairmen are as follows: objectives, Dr. James A. Van Allen; vehicles,

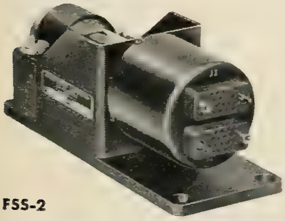


PW Switches

For Your Pulse Width Systems



DSM-180
High Level 90 channel x 10 sweeps per second, 900 samples per second, IRIG Standard, 28 volt DC drive motor, governor controlled (other units of this series available at 45 x 20 and with 400 cycle, 115 volt drive motors).



FSS-2
High Level 30 channel x 30 sweeps per second, 900 samples per second, IRIG Standard, 28 volt DC drive motor, governor controlled..

Available Directly From The
ASCOP
ELECTRO-MECHANICAL DIVISION
FORMERLY SWITCH DIVISION

Only at ASCOP can you order multiplexing switches with the high levels of precision and reliability so important to the accuracy of your pulse width systems.

When you order from ASCOP, you are buying from the largest producer of PW Multiplexers. ASCOP has over 10 years of experience in building high-speed sampling instruments that have been tested and field-proven in thousands of the most advanced military and industrial applications.

In ASCOP's extensive facilities all switches undergo the most severe environmental tests to assure long service-free life and the widest margins of dependable operation. ASCOP has a large line of standard switches and also will build components to your individual specifications. Order directly from the ASCOP Electro-Mechanical Division or write for literature.

ASCOP also designs and builds complete Pulse Width Systems.

Boeing Reveals Antimissile Project

Boeing's pilotless aircraft division is currently developing two new defensive missile projects at its Seattle plant. The new missiles are in addition to the IM-99 *Bomarc* now being produced as area defense weapons for the Air Force.

Lysle A. Wood, Boeing vice president and general manager of the pilotless aircraft division, said that both of the new projects are defensive weapon systems aimed at counteracting the threat of new enemy offensive weapons in the next decade, including ballistic missiles.

First of the new weapons is an advanced model of the present *Bomarc*. The second is an antiballistic missile system. The advanced *Bomarc* now is well along in its development stages. It would be able to seek out and destroy enemy aircraft and missiles of 250 to 400 miles. The new missile would provide additional depth and strength to the defensive protection supplied by manned interceptors, point defense missiles and shorter range area defense missiles. Identical in external appearance to the present *Bomarc*, the new missile, armed with a nuclear warhead, will fly above 60,000 feet at speeds up to Mach 5.

The anti-ICBM weapon was described only as a substantial research project undertaken by Boeing in conjunction with other firms long associated with the missile field. Object of the program is the development of a weapon system capable of detecting, intercepting and destroying ICBMs "so far above the earth that atomic fallout would not be a problem." Velocity of this anti-missile is expected to be above Mach 8.

"We have been engaged in the study and development of defensive

Simplify complex checkouts . . .

MONITOR 100 CHANNELS OF INFORMATION—*SIMULTANEOUSLY*

Unique and compact, the new Brush Event Recorder greatly minimizes the amount of time, space and equipment needed to perform complex checkouts on critical systems and processes.

On a moving chart only 12″ wide with a length of 500 feet, as many as 100 channels of sequential or operational information may be recorded simultaneously—indicating any number of events pertaining to electrical or physical phenomena.

The make-break of a relay, for example, can show as a break in a continuous trace or as a new trace; and the event itself is shown in a time relationship to all other events. Thus, you have an immediate picture of an entire situation at any time. Electric writing styli record in less than one millisecond after receiving a signal . . . handle up to 500 signal changes per second! Sixteen electrically controlled chart speeds may be selected from remote or on-the-spot locations.

Purposely designed to easily adapt to military specs, the new Brush Event Recorder is an ideal checkout instrument for use with industrial as well as defense equipment. Send for detailed literature, or ask for application assistance from your Brush factory branch or representative.

cast mandrels or cores?

Aluminum mandrels for forming solid fuel propellant are now being cast in production by the unusual foundry methods of Morris Bean & Company. While we assume there is no present need for a mandrel as large as the one on the left, it *can* be cast. Currently we are working on solid and hollow mandrels up to 8 feet long. Their smooth surfaces and accurate contours eliminate much difficult machining; cost is drastically reduced. In addition to large size, we would be happy to explore with you ways to produce intricate star-lobes. *Telephone or write.*

missile systems for the U.S. Air Force since 1945," Wood said. "Our experience has convinced us that there is no sound reason why practical and effective defensive missiles cannot be developed to counter any enemy offensive missile threat whether it be via extremely fast air-breathing missiles, combinations of missiles and manned aircraft or ICBMs."

Performance differences between the present *Bomarc* and the advanced flight vehicle will be substantial, but the ground alerting, guidance and logistical portions of the advanced *Bomarc* system would be virtually identical with those of the present *Bomarc*, thus permitting standardization of ground equipment for the two weapons. The liquid-propellant rocket currently used in the *Bomarc* will be replaced with a solid-propellant motor in the advanced version.

In addition to the announced projects, Boeing is known to be working on manned boost-glide rocket bombers, a defense against this type of weapon (Russia has been developing the T-4 boost-glide rocket for many months) and an anti-anti-missile missile missile for destroying an anti-missile defense system.

Boeing's manned glide rocket concept is believed to be a delta-winged bomber with a flat underside. It would be boosted above 100 miles by a three-engine rocket stage and propelled to approximately 16,000 mph by a single rocket sustainer.

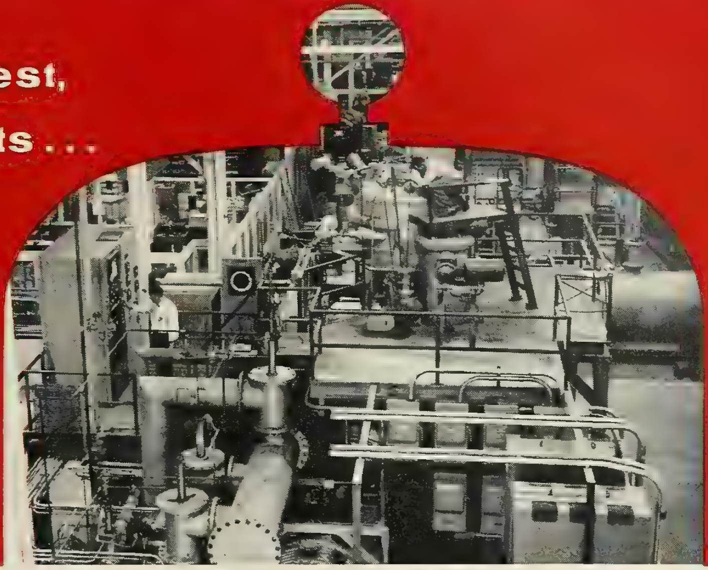
Sylvania and Army Report *Plato* Progress

Project *Plato*, the Army's anti-missile missile system has made "significant progress" in the years since its inception according to a joint report by the Army and Sylvania Electric Products, Inc. "Successful tests have been made on key components of the project," Sylvania President Don G. Mitchell said.

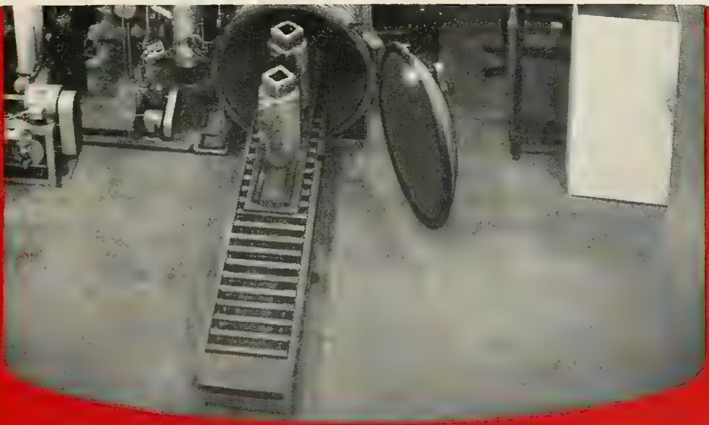
"The *Plato* Project, a mobile anti-missile missile system, is being designed to use the *Nike-Zeus* missile in the defense of overseas military installations of both the United States and its allies," he added.

Mr. Mitchell said that Sylvania, acting as prime contractor and weapons systems manager on the project for the Ordnance Corps, began working almost four years ago on the *Plato* system when it was generally considered to be "the impossible project." He said that in order to solve the anti-missile missile problem, "completely new approaches had to be conceived and developed, in addition to the application of some of the most advanced

For your hottest, toughest spots . . .



vacuum-cast super-alloy ingots and investment castings

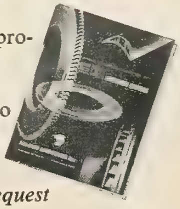


● Maximum strength can be provided in vacuum-melted, vacuum-cast super-alloy investment castings produced by Kolcast from ingot to finished part. Unique Kolcast equipment and exclusive methods keep super-alloy melts and castings free of oxygen and other strength-sapping gases.

Kolcast precision castings of Waspalloy, MT-252, GMR-235, René-41, M-308, and similar melts are poured in inorganic ceramic molds. Contours, dimensions, and surfaces of these castings are so accurate that practically no machining or finishing is required before assembly. High-cost super-alloy scrap is reduced, and expensive, slow machining is practically eliminated.

Even the most complex contours can be accurately cast by the Kolcast vacuum process. Your designs need not be compromised by the production limitations of ordinary casting methods.

Let us send a Kolcast sales engineer to talk with your designers and production men about Kolcast investment parts.



Free booklet on request

KOLCAST INDUSTRIES A DIVISION OF THOMPSON PRODUCTS, INC.

DEPT. MR-358 • 16601 EUCLID AVENUE • CLEVELAND 12, OHIO technology in the electronics field."

Lt. Gen. James M. Gavin, Chief of Army Research and Development, in discussing the application of the new system, stated that "the Army is responsible for developing, procuring and operating point defense missiles to be employed against enemy piloted aircraft and missiles of all types."

The multimillion-dollar program is under the technical supervision of the Boston Ordnance District. Three other companies have participated in supplying certain specialized services to Sylvania on a subcontract basis, including Sanders Associates, General Electric Co., and American Machine and Foundry. Sylvania's missile systems laboratory was originally established in 1953 specifically to develop the *Plato* system. It became part of the Waltham Laboratories in 1955, with the completion of a 120,000-square-foot building. Construction has been completed on a new 40,000-square-foot facility for missile systems activities, adjacent to the present building.

Sylvania has also been named a major subcontractor for the development and production of a superradar system for the detection of intercontinental ballistic missiles.

Pt. Mugu to Become National Range

Guided missile range areas supporting the existing Naval Air Missile Test Center, Pt. Mugu, Calif., will be extended to form the National Pacific Missile Range. Managed by the Navy, the range will provide missile range support to adjacent military operations, including ballistic missile training launchings from Cooke Air Force Base and Pacific Fleet missile training operations.

The new range will not supplant the triservice missile test range extending southeast from Cape Canaveral, Fla. The two ranges are complementary. For ballistic missiles the Pacific range will support training operations while Canaveral will continue to specialize in research and development support.

The Pacific range will extend along the Pacific Coast approximately 500 miles and 250 miles seaward and be supplemented by test corridors in support of ballistic missile training launchings from Pacific Coast locations to impact areas thousands of miles seaward. Test intercept for aerial targets and impact will be limited to areas free from ship and air traffic.

The new range will be equipped gradually over the next few years to support test and training operations of conventional guided missiles and the training operations of ballistic missiles (IRBMs and ICBMs).

Stavid Awarded Contract for *Regulus* Guidance

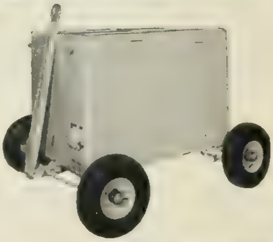
Stavid Engineering, Incorporated has received a multimillion-dollar contract to produce additional guidance systems for the submarine-launched *Regulus* missile.

The company is prime contractor for the development and production of the submarine command guidance systems used on *Regulus* I and II. It also has responsibility for maintenance of the guidance equipment with the Fleet.

Field Service Training Under Way for *Bomarc*

As the Boeing IM-99 *Bomarc* weapon system approaches operational status, major attention is being focused on the pilotless aircraft division field service program which may become the largest ever undertaken by the company, it was reported recently by James Lucas, division service manager.

Field service engineers are now in training for assignment later this



PRESSURIZATION!!!

Now get the facts on Kahn's versatile new Portable Air Stand. This dependable, portable equipment provides HIGH PRESSURE – dry air or nitrogen for pressurizing aircraft or missile systems.

- 4-Stage Compressor delivers 15 SCFM of dry air at pressures to 5000 PSIG.
- Kahn's High Pressure Automatic Dryer provides dryness of minus 65 degrees F. or lower dew point.

KAHN'S HIGH PRESSURE PNEUMATIC ACCESSORIES TEST STAND

Highly versatile 3-Station Component Test Stand delivers 5000 psi. air at minus 65 degrees F. dew point. Tests components such as Pressure Switches, Solenoids, Cylinders etc. KAHN'S INTERLOCK SAFETY feature prevents component tampering under pressure.

Inquiries Invited.

Intricate Allegheny Ludlum Steel Extrusions

cut material needs up to 60%, slash machining costs

Write for this technical book on A-L Steel Extrusions

12-pages of design and engineering information on steel extrusions. Process and product explanation, material properties, design tips and limitations, tolerances, order instructions, etc.

Address Dept. MR-3

There's no doubt about extruded shapes saving money on materials and on machining. Non-ferrous applications in the last decade have proven it.

Now even greater savings are possible with tough, strong metals in Allegheny Ludlum Hot Steel Extrusions.

Extruded shapes in all stainless grades, tool steels, carbon steels, electrical steels, high temperature alloys . . . even in zirconium, nickel alloys . . . are now in production at Allegheny Ludlum, cutting costs in many different industries.

If you're hogging out sections, paying for special mill rolls on small orders, or waiting for minimum rolling mill tonnages, Allegheny Ludlum Steel Extrusions are your answer. They will save you scrap loss, slash your machining costs, hold down your inventory requirements and cut delivery time. Charge for die design is low—under $200. Orders taken for as little as 40 pounds.

To learn more about the time and cost-cutting possibilities of Allegheny Ludlum Hot Steel Extrusions, send for the technical booklet at the left or call any A-L office for technical assistance.

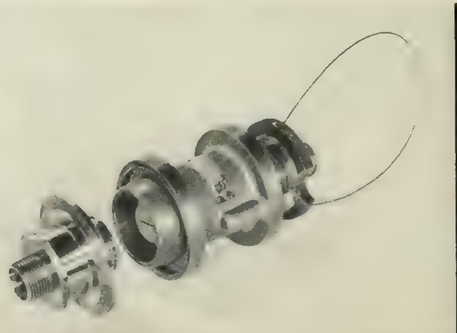
quick-disconnect couplings for missiles, aircraft and ground support equipment



Typical of the precision-built quick-disconnect couplings designed and produced by ON MARK is Part No. 5-8016-12, as illustrated. These efficient couplings range in size from ¼" to 2" inside diameter, with sizes up to 10" or larger available on special order.

Fluids handled are compressed air and gases, ordinary and "exotic" fuels, liquefied gases, peroxide, ammonia, hydraulic fluids, ethylene oxide, turbine exhaust gases and low pressure cooling air. Operating temperatures range from −340° F. to 1000° F., operating pressures from −14.7 psi to 3000 psi.

ON MARK quick-disconnect couplings utilize various operating methods — disconnecting remotely by compressed air, electrical solenoids, lanyard, pullaway, breakaway and combinations of these methods. They can also be connected or quick-disconnected with one hand in a single simple, push-to-connect motion under full line pressure of 3000 psi.

year to assist the Air Force in operating and maintaining the first *Bomarc* site near Eglin Air Force Base, Fla.

By the end of 1958, about 15 field service engineers will be on assignment as *Bomarc* technical representatives at various locations, with a substantial additional number in training for future assignments and field service support functions.

Approximately five months of the training will be spent in the *Bomarc* training school on Harbor Island in Seattle with the remainder to be on "productive job assignments" at Boeing "according to the needs of the individual."

As each *Bomarc* base is readied for operation, a "special implementation" team of field service engineers will be assigned to assist the Air Force. After the base becomes operational, the special team will move on to another *Bomarc* base, leaving two field service engineers who will remain at the base for an extended assignment.

Kearfott Adds Astronautics Lab.

Kearfott Co., Inc., Little Falls, N.J., designers and producers of flight inertial guidance equipment, recently established an astronautics laboratory within the company's navigation projects department.

This new laboratory will be responsible for the design and development of advance systems, subsystems and components for the guidance and control of satellites and space vehicles. It will draw on a decade of experience and background in terms of proven approaches and will anticipate, in view of this entirely new environment, the requirements for hardware of sufficient accuracy and long-term performance to meet the problems posed by space travel.

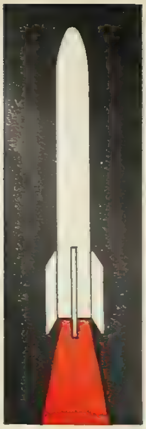
Will the Human Pilot Become Obsolete?

Methods of applying lessons learned from rocketry to civilian aircraft will be one topic of a special conference of the American Society of Mechanical Engineers, to be held in Dallas, Tex., March 16-20.

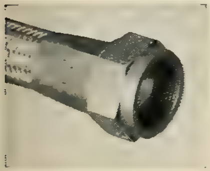
The joint aviation conference of The American Society of Mechanical Engineers and its affiliate, the American Rocket Society, will consider such topics as whether human pilots will become obsolete, how to keep pilot and passengers comfortably cool in aircraft speeding through the thermal barrier, the use of special high-energy fuels in passenger planes, guided missile instrumentation and lunar colonization.

Water is sprayed over protective clothing of engineers to wash away residue as they load fuel into rocket. Transfer line is Aeroquip 610 KEL-F Hose.

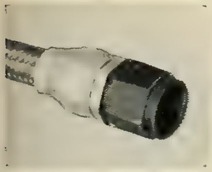
problem:
transfer of dangerous nitric acid during missile fueling operations



Aeroquip Solved it with Corrosion-Resistant KEL-F Hose



610 Hose Lines of KEL-F* for nitric acid transfer.



Hose Lines of TEFLON** for fuel and oxidizer supply lines.

Through the development of 610 KEL-F Hose for safe transfer of nitric acid, Aeroquip again demonstrated its ability to meet the wide range of fluid line requirements in the missile industry. 610 KEL-F Hose is but one of many new Aeroquip products designed for specific missile applications.

Years of experience in the aircraft and missile fields helps Aeroquip recognize, even anticipate, plumbing problems. Extensive research, development and engineering facilities, plus highly qualified personnel, assure solutions to even the most extreme fluid line problems.

Engineering assistance is available. Mail coupon below for complete information.

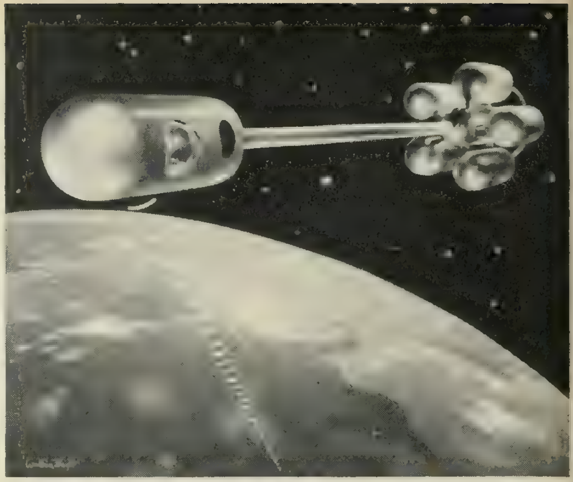
TEST INSTRUMENTS Bulova's rugged Tachometer Tester for all jet and reciprocating systems meets MIL-T-945A requirements—is accurate to 0.1% with engines on or off. Simple to operate and maintain, this field unit also serves in maintenance depots. Precise Bulova testers include the dual purpose Torqmeter—a dynamometer or calibrated torque source



RECONNAISSANCE SYSTEMS Bulova-developed miniaturized sensor packages, geared to specific tactical missions, feed combat surveillance data to Bulova analysis and display systems. Camera, infra-red, TV and radar techniques, combined and integrated, aid decision-making on land and in space. Satellite applications? Unlimited!

Bulova's capability helps to solve today's most challenging problems

To conceive, develop and manufacture a broad range of advanced electronic and electro-mechanical devices... this is the Bulova capability.

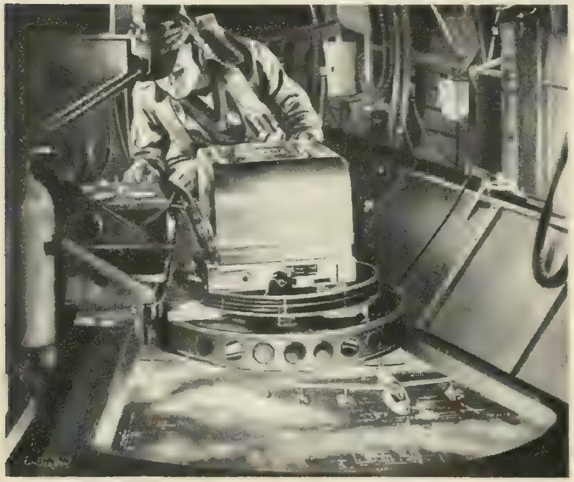
Meeting the needs of defense and industry is an unusually creative group of scientists, engineers and technicians, backed by 80 years' experience in precision production.

With dynamic imagination, Bulova's capability has invaded the often uncharted technological areas to originate many modern-day miracles in miniaturized systems and components.

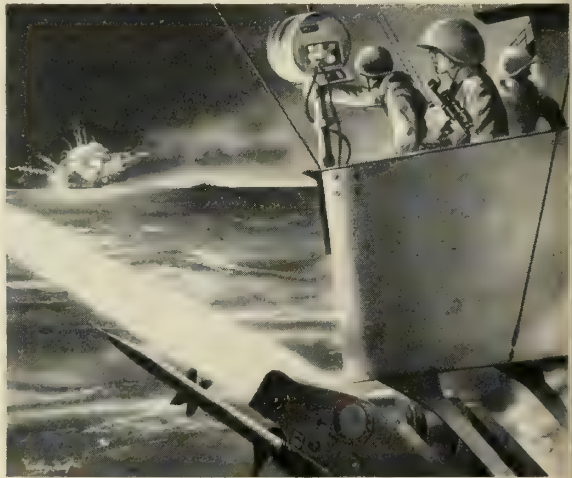
Here is a proven capability ready to assist you from concept to mass production. For full information, write Department G.I.S.-2.

BULOVA
watch company

BULOVA RESEARCH AND DEVELOPMENT LABORATORIES, INC.
BULOVA PARK — JACKSON HEIGHTS — NEW YORK



INFRA-RED COMPONENTS Bulova's advanced IR projects include mosaic cells that will automatically filter out unwanted wave lengths and picture targets clearly against any background. Bulova infra-red R&D covers lead selenide and lead sulfide cells, missile seeker cells, reticles, filters and thermistor bolometers... for defense and industry.



INFRA-RED SYSTEMS Bulova's IR illuminators put unseen spotlights on night objectives. Bulova's development capability extends to fire control systems that detect, track and automatically lock on target. Designed for accuracy and simplicity, these high resolution units will serve our nation's land, sea and air forces.

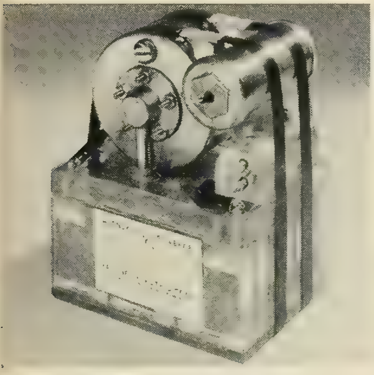
NEW MISSILE PRODUCTS

AUTOMATIC ACTIVATION

Yardney Electric Corp. has developed a new high-speed method of automatic activation which features an efficiency ratio allowing complete interchangeability between Yardney Silvercel primary and secondary batteries. The process also allows Yardney batteries to be activated and operated in any position. Automatically activated primaries can be made equivalent to secondaries in power rating, weight and size, and secondaries may be used for exercise and test runs. Simultaneously, equivalent primaries may be utilized for tactical end use.



Now used in Silvercel primaries, the new method replaces the slower mechanical activation process, which depended on gravity and required that liquid primary cells remain in an upright position. Activation may now be accomplished in seconds, and the battery is then ready to provide 100% power.

The activation mechanism consists of three parts that may be placed in whatever position will best fit space requirements. Illustrated is an ICBM battery weighing 10 lbs. and using the automatic activation process. When a spring-loaded plunger is triggered, it breaks a gas tank seal. The gas inflates a bladder at one end of a hermetically sealed electrolyte cylinder and the electrolyte operates a snap valve at the opposite end. The electrolyte is forced into the feed tube to the manifold, where it is evenly distributed through feed holes into the individual cells.

Special vents permit the escape of surplus electrolyte, gas and vapors through a return manifold into a sump. Since the electrolyte is originally in a separate container, and it is not in contact with the electrodes until the battery is activated, the Yardney Silvercel primary may be stored in the dry state for long periods.

Circle No. 225 on Subscriber Service Card.

ELECTRONIC FILTER

A dual unit, direct coupled, electronic highpass/lowpass filter is now available from Spectrum Instruments, Inc. Model LH-24D is designed for installation in standard 19" rack or table cabinet and offered for a variety of applications demanding availability of response to dc, or zero frequency.

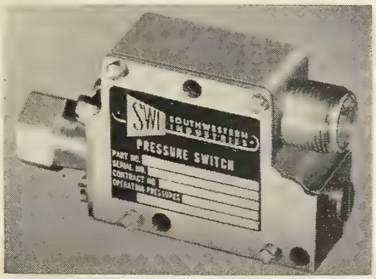
The two individual filter units are identical and may be converted from highpass to lowpass, or vice versa, by manipulation of a panel selector switch. The units may be used as independent filters or interconnected to secure bandpass, bandstop, or highpass/lowpass operation with doubly steep rate of cut-off. The individual section cut-off frequency is continuously adjustable over five decades extending from 0.2 to 20,000 cycles/sec.

Circle No. 226 on Subscriber Service Card.

MINIATURIZED PRESSURE SWITCHES

A series of miniaturized, lightweight, high-pressure, vibration-damped pressure switches for missile applications has been developed by Southwestern Industries, Inc. Weighing approximately 0.4 lb. the series PS 3800 switches operate in inert gases and fuels, engine and hydraulic oils and aromatic fuels and are designed to withstand vibrations up to 25g's, from 10 to 2000 cps. Small and compact, they are flush-mounted and allow installation in applications where sensitive response must be accomplished under conditions of extreme vibration.

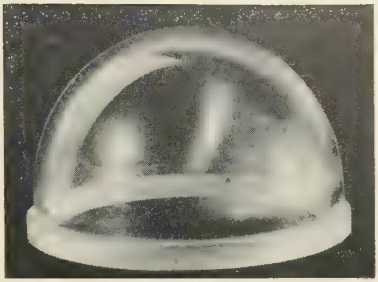
Because the pressure switches are externally adjustable, they can be readjusted through their actuation pressure range as required by the installation. The PS 3800 series is available in actuation pressure ranges from 400-2000 psig (proof pressure 4000 psig) or 2000-3500 psig (proof pressure 5000 psig). Actuation to deactuation maximum differential pressure is 250 to 350 psi. Operating temperatures range from –40° to +160°F.



Circle No. 227 on Subscriber Service Card.

INFRARED DOMES

A new method of producing infrared protective domes has been developed by Precision Lapping Co., Inc. The irdomes can be obtained with spherical curvatures ranging from a slight meniscus to considerably more than a hemisphere, and in aspheric shapes. Physical dimensions are controlled during manufacture to achieve extremely close tolerances. After final grinding and polishing, spherical tolerances are held to millionths of an inch, diameters to ten thousandths, and concentricity between inner and outer surfaces within ten thousandths.



Dome materials may be specified according to user requirements of band spectrum, thermal shock resistance, abrasion resistance strength, and diameter needed. Quick deliveries can be made on domes of quartz, silicon, calcium aluminate, sapphire, arsenic, trisulphide, germanium, glass or metal. Sizes range from 1" to 72" in diameter, with integral flanges if desired. When dome must be larger than material available, *i.e.*, sapphire, small sections can be bonded or fused together to form the blank.

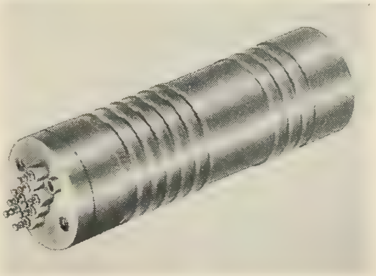
MAGNETIC AMPLIFIER

The 100C series, low-level DC magnetic amplifier developed by California Magnetic Control Corp. has been designed for a wide range of applications in electronic and electrical control systems where light weight, minimum bulk and high reliability are important factors. Its characteristics make it adaptable for use in missiles, atomic reactor control circuits, and in industrial control equipment.



This low-level DC amplifier weighing only 6 oz. and occupying about 6 cu. in. of space, has a significantly higher degree of reliability than vacuum tube and transistor amplifiers of much greater size and weight. It is polarity sensitive, and

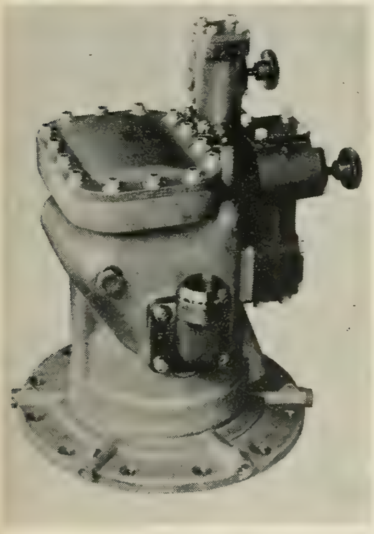
HYDRAULIC PUMP

A new variable delivery, variable pressure, hydraulic pump capable of pressures to 5000 psi has been announced by Vickers Inc. The pump has passed an Air Force 1000-hour qualification test (MIL-S-26874 and 26877) requiring operation at 5000 psi for more than 10% of the test time. During the test, the unit completed in excess of 23,000 duty cycles from zero flow to full flow.

The pump is designed to deliver 38.2 gpm at 3750 rpm and 3000 psi. Minimum life for steady-state operation at this pressure and flow is approximately 1335 hours. At 5000 psi and 3750 rpm, delivery is about 38.2 gpm with minimum life of approximately 288 hours. Vickers reports very low internal pump leakage with high overall reliability as standard design components with proven long service records are used.



This new 5000 psi pump was designed for hydraulic test stand use, missile launching, jet engine starters, checkout stands, and mobile shop equipment that can advantageously utilize the high reserve power feature of the pump.

RELIABILITY POSES FOR ITS PICTURE

At Raytheon, hundreds of subminiature tubes are checked each day by an automatic X-ray process. Microscopic welds and spacing of elements are scrutinized to help assure reliable operation even under the most critical conditions.

Excellence in Electronics

RAYTHEON

This is only one example of the rigorous inspection and testing techniques that have earned for Raytheon components and systems a reputation for the utmost in reliability.

RAYTHEON MANUFACTURING COMPANY, WALTHAM 54, MASS.

mutators are available in a wide selection of poles and positions, and in speeds from 1/8 to 30 rps.

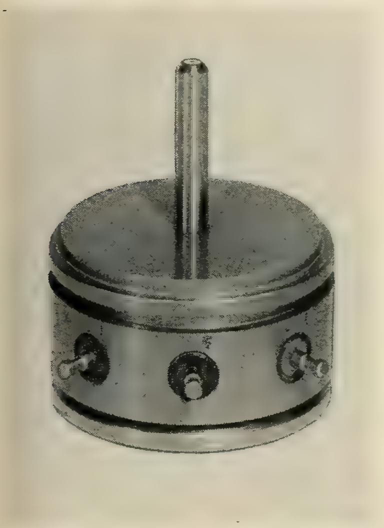
Circuits available are two independent switch sections per commutator on the model TSC-50, and three independent switch sections on the model TSC-51. Drive motors are available for operation on 115v, 400 cycles AC or 26.5v DC.

Rated performance is achieved at temperatures to 85°C and vibration of 25g to 2000 cps. Weight is less than 2 lbs., and power requirements are 10 to 20 watts, depending on speed and number of poles.

Circle No. 231 on Subscriber Service Card.

METAL FILM POTENTIOMETERS

A new type of metal film precision potentiometer is now being manufactured by the Magnetics Division of Servomechanisms, Inc. The resistance element of the potentiometer is made of alloys developed for this purpose, evaporated in high vacuum and deposited onto a ceramic disc. The process involves the carefully controlled transfer of the metal in its vaporized state to build up coatings of desired shape on the prepared surface of the ceramic base or "substrate." Thickness of the coatings can be controlled to produce accurately the desired electrical characteristics. The entire process can be accomplished by the use of fully automatic equipment.



Made entirely of inorganic materials —ceramic and metal held together by molecular bond—the rugged construction enables the unit to withstand extreme tests of vibration, shock and humidity. Tests conducted to date indicate superior performance and dependability at temperatures of 150°C and higher.

The uniformly deposited resistance element offers substantially infinite resolution together with low noise and relatively small contact and end resistance, eliminating the problem of "hunting" in high-performance servo loops. Together with the patented contact brush, it assures long rotational life and continued low noise level. Although power rating is generally stated at 2 watts (with temperature of 150°C), both the brush and the resistance element are capable of dis-

New Books on

ROCKETS AND MISSILES

EXTERIOR BALLISTICS OF ROCKETS

By Leverett Davis, Jr., California Institute of Technology; James W. Follin, Jr., Applied Physics Laboratory, The Johns Hopkins University; and Leon Blitzer, University of Arizona

This book develops the basic theory of exterior ballistics of both spin- and fin-stabilized rockets, emphasizing both the physical understanding of rocket behavior and its mathematical description. Based on the efforts of many dedicated individuals, through successive versions and stages of security classification, this useful volume now brings to all those desiring a familiarity with the science of rocket ballistics an essential foundation upon which to build the skills required for more advanced work today. **458 pages, $8.50**

MISSILE ENGINEERING HANDBOOK

By C. W. Besserer, Technical Staff, Ramo-Wooldridge Corporation

This fourth volume in the series PRINCIPLES OF GUIDED MISSILE DESIGN brings together important handbook data and a glossary of guided missile and space flight terms—useful for reference and for preliminary design, parametric studies and instruction. For all figures and charts, the book explains limits of accuracy and range of application for maximum practical usefulness. Like its predecessors in the series, this volume has been prepared to provide engineers, designers and technicians with a thorough grounding in the technology of guided missiles. **608 pages, $12.50**

Other titles in the series

PRINCIPLES OF GUIDED MISSILE DESIGN

AERODYNAMICS, PROPULSION, STRUCTURES AND DESIGN PRACTICE

By E. A. Bonney, M. J. Zucrow and C. W. Besserer

Fundamentals of supersonic missile aerodynamics, means of propulsion and structural design. **$12.50**

GUIDANCE

By Arthur S. Locke. Considers all basic problems in directing a controlled missile reliably to its target. **$12.50**

OPERATIONS RESEARCH, ARMAMENT, LAUNCHING

By G. Merrill, H. Goldberg and R. H. Helmholz

Research as a decision-making tool; armament for target destruction; and launching design as a method of achieving initial flight. **$12.50**

ONE HOOK CAN'T CATCH ALL FISH

One tape can't serve all recording needs in magnetic instrumentation

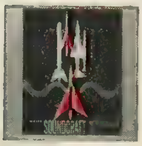
There are differences between pulse and carrier recording . . . therefore the tapes used in these systems must have different characteristics. Only in Soundcraft Instrumentation Tapes are these distinct and separate properties engineered into the oxide formulation. Soundcraft then adds two original processes — Uni-Level Coating and Micropolishing — to achieve the surface perfection found exclusively in the most advanced tapes of our time:

Soundcraft Type A Tape for Digital Recording

Soundcraft Type B Tape for Telemetering

Get the Soundcraft Tape that's made for your application . . . get error-free recording!

RCCH oxide formulation gives "Type A" higher signal output and greater retentivity plus unique surface hardness for controlled tape wear rather than uncontrolled equipment wear.



The special FM formulation in "Type B" is a highly refined form of gamma Fe_2O_3 oxide with high temperature binders, lubricants and anti-static agents to assure uniform speed and tape-to-head-contact — preventing flutter.

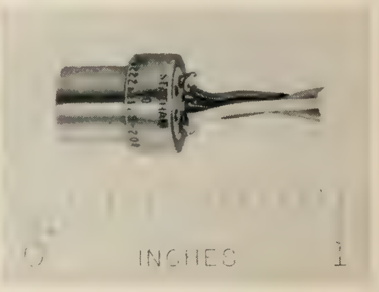
PRESSURE TRANSDUCER

A tiny flush-diaphragm pressure transducer approximately 1/8 the size of miniature instruments now in use has been developed by Statham Instruments, Inc. The unit has a diameter of 0.25", measures 0.47" in length and weighs 3 grams.



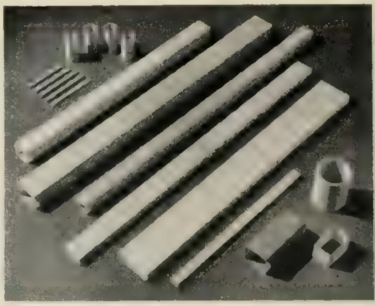
Due to the small dimensions, the model P222 pressure transducer is adaptable to many application possibilities in which the measurement of gage differential and absolute pressures are required.

Using the principle of the unbonded strain gage, the circuit of this subminiature instrument forms a complete bridge with a nominal resistance of 200 ohms. It has an output of approximately 15 millivolts full-scale open-circuit at 3 volts excitation. The wide ambient temperature limits of –100° to +275°F and the availability of pressure adapters for conversion to closed line applications extend the potential use of the instrument.

Circle No. 233 on Subscriber Service Card.

HIGH-TEMPERATURE CORE TUBES

Silicone Insulation, Inc., has developed new equipment producing rectangular and round high-temperature core tubes with a minimum of tooling costs. Class "H" tubes are of laminated silicone glass cloth. They are designed to meet the requirements of military specifications MIL-E-917B for electrical power equipment and MIL-E-16400A for electronic equipment. Class "B" tubes are of laminated polyester glass cloth or laminated epoxy glass cloth.



Semistandard sizes comprise rectangular tubes with both internal dimensions between ¼" and 2" and round tubes with internal diameters between ¼" and 2". The nominal wall thickness of these tubes

PRECISION ACCELEROMETER

A completely transistorized precision linear servo accelerometer, Model 4310, has been introduced by Donner Scientific Co. The unit is available in ranges from ± 0.05 g to ± 50 g. The maximum output is either ± 7.5 or ± 1.5 ma, eliminating auxiliary amplifiers required by other types of accelerometers. The Model 4310 is portable and can be operated from a simple battery power supply providing ± 15 v at 6 ma. Repeatability is 0.01% of full-scale and linearity is within 0.05% of full-scale. The entire unit weighs only 3.2 oz. When weight and space requirements are even more critical the acceleration pickup portion can be separated from the servo-amplifier part of the instrument and installed in a remote location.

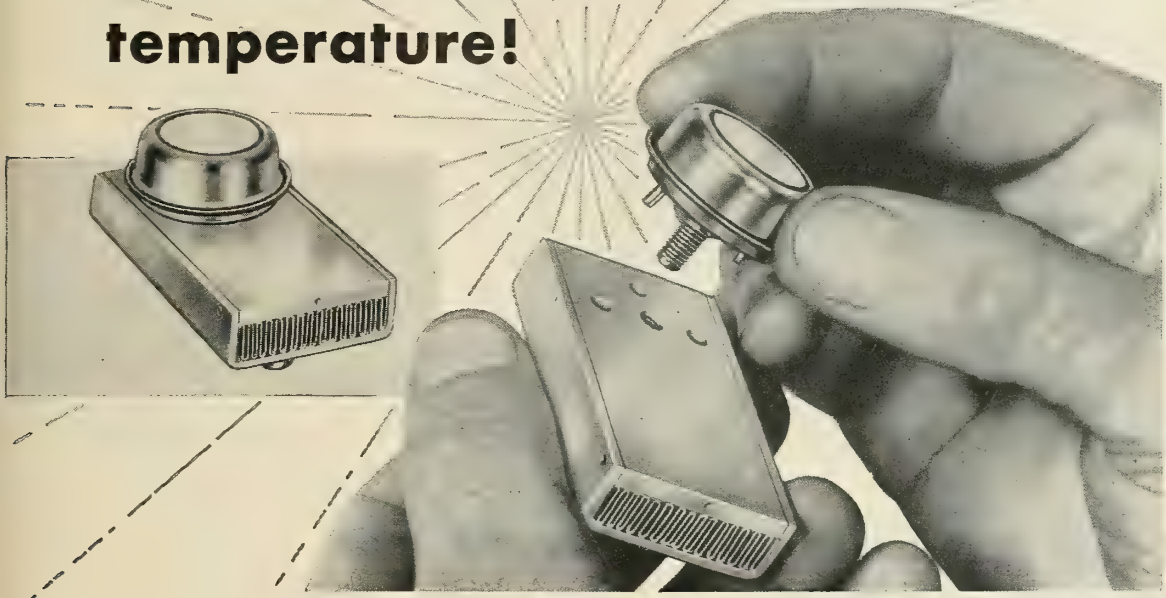
COUNTER-TIMER

Systron Corporation has introduced a single package in-line megacycle-microsecond counter-timer in its Model 1031, now in production. Providing flexibility and reliability for laboratory applications, it measures: frequency to 1 mc, time and period in 1 microsecond increments, phase angles in 0.1° increments, events to 7 digits, ratio of 2 frequencies, and acts as a secondary frequency standard.

The principal feature of the equipment is the in-line display of informa-

UAP COLD PLATE controls TRANSISTOR junction temperature!



minimizes transistor derating for thermal conditions . . .

UAP cold plate U-521330, designed for Collins Radio Company, dissipates heat generated by power transistors used in ground and airborne electronic circuits. The heat is transferred across a pressure thermal contact to cooling air. The cold plate controls the transistor junction temperature within operating limits compatible with the installation. Therefore, transistor derating is minimized.

The cooling air, which is forced through the cold plate, can be ducted from an air cycle refrigeration system; a ram air supply; an air manifold within the electronic compartment or a pressurized equipment package.

The aluminum cold plates are bonded by UAP's dip braze method which produces extremely lightweight assemblies with maximum heat transfer area within the core. Cold plates can be used individually or assembled in manifolded banks.

DESIGN PERFORMANCE CHARACTERISTICS OF U-521330 COLD PLATE

Air flow: 7 lbs. per hr.
Air pressure drop: 0.25" H_2O corrected to .0765 density
Temperature drop in cold plate: 1.5°C per watt dissipated
Weight: Approximately 1 oz.
Performance characteristics can be modified to requirements.

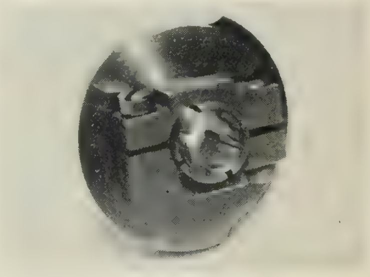
tion. The well-illuminated 1"-high numerals are clearly readable at distances up to 30 or 40 ft.

Outstanding features include: remote in-line indication, the use of the Burroughs beam-switching tubes for the counting decades with corresponding reduction of conventional vacuum tubes, and modular construction for all amplifiers and control circuitry.

Circle No. 236 on Subscriber Service Card.

ADJUSTABLE CAM ASSEMBLY

Sterling Precision Corp. has developed an adjustable cam assembly designed for use in servomechanisms where it is desired to actuate switches and similar devices at predetermined angular limits.

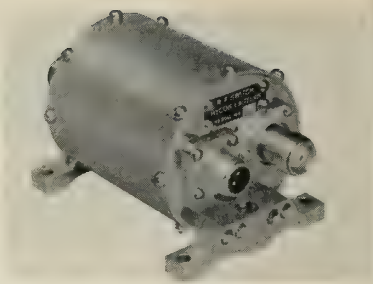


Two stainless steel cams may be rotated relative to each other to permit adjustment between rise from 0° to 180°. A balanced clamp secures the assembly to the shaft as well as locking the cams for the desired setting. Maximum diameter is 1 1/8" and hubs are available for 1/8", 3/16", and ¼" shafts.

Circle No. 237 on Subscriber Service Card.

HIGH-POWER RF SWITCH FOR SEVERE ENVIRONMENT

Hycon Eastern, Inc. has introduced a high-power RF switch, type 1696, that will withstand the severe environment encountered in advanced missiles. The new component will switch a transmitter from one antenna to another at high-power levels without mismatching the transmitter. In other words, this unit may be safely switched under power.



Environmental specifications are: shock to 100g; vibration 20g at frequencies up to 2000 cycles; temperature -40°F to +250°F; altitude unlimited because unit is pressurized.

Other specifications include: frequency range: 215 to 250 mc/s (other ranges on special order); attenuation: 0.25 db, maximum; power rating: 100 watts RF CW; VSWR: 1.2 maximum; switching: .15 sec. average; size: approximately 2½" diameter by 4½" long; weight: 2 lbs.; actuating power: 6 watts dc; crosstalk: 27 db down into unused channel; sequence: make-before-break.

WANTED
A SALES MANAGER FOR BANG-UP JOB

We have a challenging opportunity for an unusual man in his thirties with a degree in Chemistry or related field; a man who can sell and who also has some missile or rocket development know-how. The project—to set up a sales organization, obtain new business and set the stage for future development in the field of explosive and pyrotechnic devices related to the rocket and missile industry and to negotiate research and development type contracts. Will require the writing of detailed proposals. Extensive travel from New England base. Please send comprehensive resume—P.O. Box 101-A, MISSILES & ROCKETS Magazine, 1001 Vermont Ave., N.W., Washington 5, D.C.

Thiokol®
THE LEADER IN
SOLID PROPELLANT ROCKET DEVELOPMENT
HAS SEVERAL OPENINGS FOR
MECHANICAL ENGINEERS

B.S. in mechanical engineering and five years professional experience desirable. Specific assignments involve project and design engineering on solid propellant rocket engines. Prior experience in this or related fields is preferred.

1958 is a bigger year than ever for solid propellant rockets and THIOKOL is growing to meet the challenge of things to come.

For growth opportunity, send your resumé and salary requirements to:

Mr. Richard D. Willis, Personnel Director
Thiokol Chemical Corporation, Elkton, Maryland

ELECTRONIC COMMUTATION

ELECTRONIC COMMUTATOR

ARNOUX CORPORATION
LOS ANGELES, CALIF
PAT. APPLIED FOR

...FOR *Airborne* TELEMETRY

Model ETC-30-10-P.A.M.-1

30 Channels — 10 Samples /Sec.

- Directly replaces mechanical commutators in 0-3 Volt and 0-5 Volt airborne telemeter applications.
- Available in all standard sampling rates required for P.A.M. and P.D.M. commutated systems.
- Meets all I.R.I.G. requirements, exceeds MIL E-5272A specification.
- Errors due to drift, cross-talk and non-linearity less than 0.50 percent under MIL E-5272A environment.
- Noise-free operation assured for thousands of hours without maintenance.
- Twenty-Seven (27) information channels, plus Master pulse.
- Unique limiting feature eliminates need for limiters elsewhere in system.
- Power Requirement: 150V DC at 12 ma.
- Size: 3" diameter x 5" long.
- Weight: Less than 2 pounds
- Extreme reliability is achieved through use of a simplified counter circuit in conjunction with an advanced-design silicon diode switching matrix.
- Design life expectancy is at least 5000 hours without maintenance of any kind.

The Johns Hopkins University
Applied Physics Laboratory

ANNOUNCES

. . . important openings on our guided missile research and development staff for men who wish to identify themselves with an organization whose prime purpose is scientific advancement.

Because the Applied Physics Laboratory (APL) exists to make rapid strides in science and technology, staff members require and receive freedom to inquire, to experiment, to pursue tangential paths of thought. Such freedoms are responsible for findings that frequently touch off a chain reaction of creativity throughout the organization. As a staff member of APL you will be encouraged to determine your own goals and to set your own working schedule. You will also associate with leaders in many fields, all bent on solving problems of exceptional scope and complexity.

Equidistant between Baltimore, Md., and Washington, D. C., our new laboratory allows staff members to enjoy suburban or urban living and the rich cultural, educational and research facilities offered by both cities.

Openings Exist in
These Fields:

DESIGN: *Airframes and structures; hydraulic and power supply systems; servomechanisms; launching and handling equipment; ramjet engines; warheads.*

ANALYSIS: *Stress; weights and loads; heat transfer; dynamics; warheads.*

SEND NOW FOR OUR NEW 30-PAGE PUBLICATION DESCRIBING IN DETAIL THE SCOPE OF THE LABORATORY'S PROGRAMS AND THE UNIQUE ENVIRONMENT IN WHICH STAFF MEMBERS WORK AND LIVE.

West Coast Industry

by Fred S. Hunter

The night shift is back in business at Rocketdyne's test facility in the Santa Susanna Mountains, and once again test firing have been booming out over the rooftops of the San Fernando Valley long after the sun has gone down. These midnight firings reflect an accelerated program on *Atlas* engines. The *Atlas* people are unusually busy these days since they have to complete their test firing program this year to provide the production articles due in 1959. The *Atlas* now also has an added responsibility: minus warhead, it's to be the initial boost stage of the four stages of the WS-117L, the earth satellite reconnaissance vehicle being developed for the Air Force.

•

Temco's air-to-surface *Corvus* will equip the new low-level attack aircraft which Grumman is to build for the Navy, as well as the Martin P6M. Meanwhile, the Martin *Bullpup,* now being evaluated at Point Mugu and reported progressing satisfactorily, is to be used on attack-fighter aircraft such as the Douglas A4D. It may even be used on any propeller-driven ADs that may still be operational when the missile—radar guided—goes into service. Later on will come a more advanced air-to-surface weapon called the *Raven,* around which the Navy plans to design and build an entirely new aircraft. A contractor for the *Raven* may be selected shortly. Another new missile, a more sophisticated air-to-air bird called the *Eagle,* is reported also on the Navy schedule.

•

The Navy regards its 19,000-acre portion of Camp Cooke, the West Coast ballistic missile facility, as being ideal for this scale of operations because of sea-facing deep canyons. Moreover, Cooke is said to be the only place in the United States where a satellite could be launched sea-wise in a N-S direction due to coastline curvature. This orbit is needed so the satellite can "see" different portions of the earth. The Pacific test range, to be established for operation by Point Mugu and Cooke, will make an excellent complement to Cape Canaveral. The vastness and emptiness of the Pacific will provide more flexibility in firing missiles.

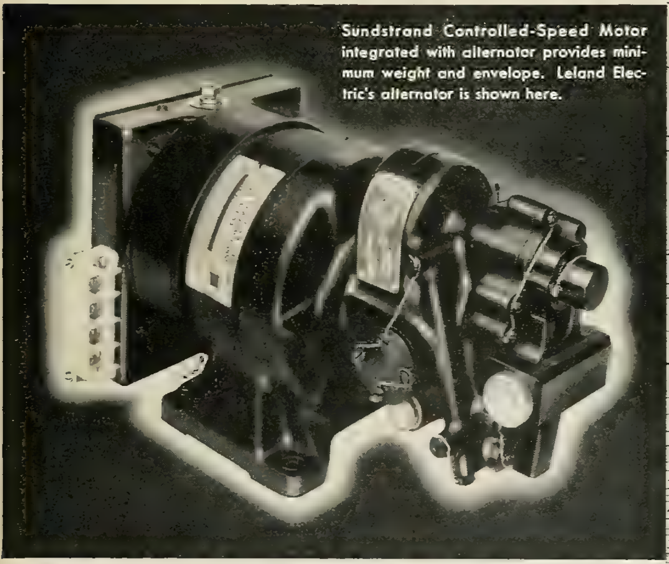
•

Marquardt Aircraft's new "Astro" division's activities can be expected to step up now that the new model test facility in the Newhall-Saugus area north of Los Angeles is complete. There's also some talk of a facility at Yucca Flat in Nevada. Marquardt has two nuclear projects in the shop now, one being a prime contract in the Air Force nuclear propulsion program. The other is a contract from General Electric for the development of a turbojet-engine control system designed for use with GE's nuclear power turbojet.

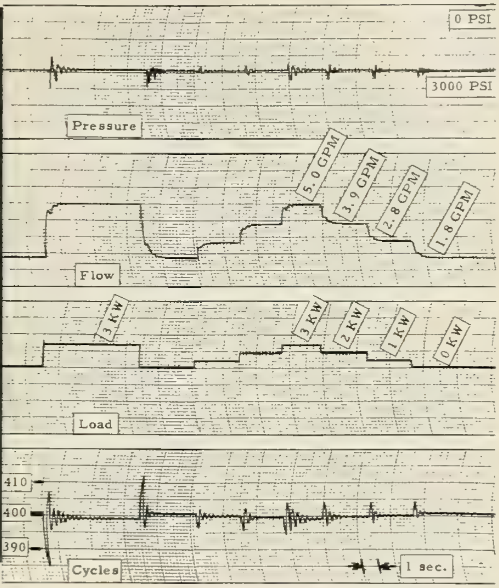
•

B. F. Coggan, general manager of the San Diego division, discloses that Convair is exploring the fantastic new field of antimatter. Physicists recently have shown that elementary particles, such as protons and antiprotons, release large amounts of energy on contact. It's possible that antimatter energy may be even more fundamental and powerful than nuclear fusion. Coggan suggests more knowledge about antimatter may supply the master key which will unlock many of the universe's innermost secrets—magnetic fields, aurora borealis, gravity. From this may come antigravity devices. And beyond this Coggan believes antimatter energy will be used in the future for propulsion to explore the universe.

New Electrical Power System for Missiles and Aircraft



Sundstrand Controlled-Speed Motor integrated with alternator provides minimum weight and envelope. Leland Electric's alternator is shown here.



Oscillograph trace of power-generating system performance with basic flyball governor. Governor trimming methods provide more precise control.

Operates off general hydraulic system, provides 4 kva rated power, capable of 100% overloads

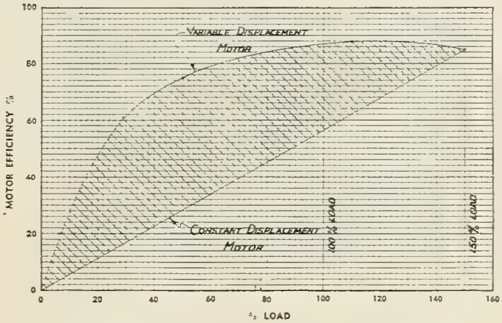
Use of a Sundstrand controlled-speed, variable-displacement hydraulic motor to drive a 400-cycle alternator provides an emergency and isolated electrical power-generation system with many desirable characteristics.

High efficiency throughout the operating range is assured because speed of the motor is controlled by varying the displacement to match the required torque output. The motor takes only that flow of oil from the general hydraulic system required to maintain the driven load. This eliminates the inefficient throttling necessary in a fixed-displacement motor system. There are no discontinuities in speed control from no load to full load.

The system is capable of handling 100% overloads for extended periods.

Integration of the motor in a common housing with the alternator provides minimum weight and envelope . . . maximum resistance to shock and vibration . . . and increased reliability. The integrated package also permits cooling the alternator with oil when air cooling is impractical.

The motor shown has a self-contained flyball governor. Models with external speed controls are available where variable speed is required. The motor itself is particularly suited to driving any load where torque requirements are variable and heating of hydraulic fluid is critical.



Efficiency advantage of variable-displacement motor over fixed displacement motor is shown for loads ranging from 0 to 150% of rating.

- 4 kva with 1.0 power factor
- -65° F to +275° F temperature range
- Higher temperature models available
- Speed control within ±1/10% with trim
- ±1½% with self-contained governor
- One-second transient response

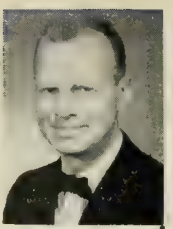
World Astronautics



by Frederick C. Durant III

Optical tracking of earth satellites requires enthusiasm, technical appreciation, self-discipline and teamwork, in addition to simple but good optical and timing equipment. The Smithsonian Astrophysical Observatory (SAO) at Cambridge, Mass. has done an excellent job in staffing and outfitting the official U.S. Moonwatch tracking stations in many countries. Certification of competency of these teams in each country is made by a satellite coordinator appointed by the national IGY Committee. It takes dedicated effort to assure the complete manning, upon call, of the spotting 'scopes at dawn and dusk. Each team is comprised of 20 to 100 persons to compensate for fatigue, illness and those who may suddenly drop out for personal reasons.

A total of 205 Moonwatch teams in 11 countries were accredited and officially registered by last December. Of these, 114 are in the United States and 71 in Japan, 4 each in Argentina, Australia and the Union of South Africa, 3 in Chile, and 1 each in the Belgian Congo, Mexico, the Netherlands Antilles, Peru and Uruguay. The high interest in Japan was reported in m/r earlier (July 1957).

To date, the Japanese have responded to this scientific call in far greater numbers than any other foreign nation. The SAO recently issued a report of activities during the eight weeks after the launching of *Sputnik* I. During these first two months of the satellite era the Moonwatch teams of only four out of the 11 countries contributed to the 391 observations reported. The United States turned in 244 data reports of sightings, Japan, 128, Australia, 13 and Chile, one. The foreign sightings are particularly important because of their location in the Eastern and Southern Hemispheres. The Japanese made one-third of all the reports. Australia had the highest number of reports per team per country.

The Netherlands Antilles team has reported sightings since December. The major reason for holdup of Moonwatch operations in other countries has been delay in obtaining equipment. Ideally, an industrial sponsor is obtained to cover the cost of about $2000 to obtain basic equipment. There are no salaries.

The largest object, the final stage of the launching vehicle, was designated 1957 α_1; the satellite proper, α_2. These appellations follow astronomical practice. A third object, in all probability the protective nose cone, is designated α_3. Incidentally, it was a Japanese team that first sighted all three elements of *Sputnik* I, although other teams subsequently reported similar sightings while α_1, α_2 and α_3 were still near each other. The U.S. *Explorer* satellite launched by the Army *Jupiter*-C became the first 1958 satellite, and thus, 1958 α_1, etc.

•

Quite a spate of Russian books on space flight are available in the United States. Both paperbacks and hard covers may be purchased at the Telberg Book Co. and Four Continent Book Store in New York City. Although most works are in the original language, there is an excellent book by K. E. Tsiolkowskii translated into English.

•

26 February to 1 March an astronautical meeting was held at the Loccum Evangelican Academy, at Loccum-Hanover, Germany. This is believed to be the first such extensive space flight discussion at a religious institution. Such well-known astronautical personalities as Dr. Eugen Saenger, Dipl. Ing. Heinz Gartmann, Andrew G. Haley and Dr. H. von Diringshofen were on the program.

To the ENGINEER of high ability

The most important engineering assignments are now being placed with companies which can point to superior accomplishments not only in research and development, but in production of the end items. Because of this, engineers interested in aircraft and missile components and systems will find outstanding opportunities at the Garrett Corporation. Our prime areas of operation include the following:

air-conditioning

pressurization

heat transfer and cryogenics

pneumatic valves and controls

system electronics, computers and flight instruments

gas turbine engines and turbine motors

The Garrett Corporation also has made important advances in prime engine development and in design of turbochargers and other industrial products.

Our engineers work on the very frontiers of present day scientific knowledge. We need your creative talents and offer you the opportunity to progress by making full use of your scientific ability. Positions are now open for mechanical engineers . . . mathematicians . . . specialists in engineering mechanics . . . electrical engineers . . . electronics engineers.

For further information regarding opportunities in the Los Angeles, Phoenix and New York areas, write today, including a resume of your education and experience. Address Mr. G. D. Bradley

Rated flow__________.12 to 15 gpm

New AiResearch Time Dwell Servo Valve overcomes performance and reliability limitations of present hydraulic control systems

Acceleration switching is a new control technique which provides for positive control of spool velocity, allowing the servo system engineer to achieve resolution, reliability and response previously unattainable. Significant advantages include:

- Unimpaired operation in contaminated oil
- Less than 5% null shift between –20°F and +700°F
- Infinite resolution
- High spool control forces (≅ 100 pounds) at *all* signal levels
- High pressure gain (10 times linear valve)

Outstanding opportunities for qualified engineers

Space Medicine

by Hubertus Strughold, M.D., Ph.D.

In addition to Col. Paul Campbell's Space Medicine Panel, as reported in my last column, there will be a panel on Simulated Atmospheres and Foreign Environments in Space Operations at the annual meeting of the Aeromedical Association, March 24-26, at the Hotel Statler, Washington, D.C. This panel will describe experiences in sealed gondolas with simulated atmospheres in recent ultrahigh balloon flights, in space cabin simulators, pressure suits and submarines. Other topics will be terrestrial microorganisms in a simulated Mars atmosphere and the medical significance of ozone. The writer will be chairman of the panel.

•

The symposium on Physics and Medicine of the Atmosphere and Space, sponsored by the School of Aviation Medicine, will be conducted by the Southwest Research Institute of San Antonio. It will involve medical problems in aeronautics and astronautics, and will emphasize the Geophysical Year. There will be about 40 speakers on the program, eight of them from Europe. It is scheduled for November 11-14 at the Hilton Hotel, San Antonio.

•

At the Annual Meeting of the Institute of Aeronautical Sciences held in New York City recently, a film was shown depicting Capt. Julian E. Ward (Department of Space Medicine, School of Aviation Medicine) drinking water in the gravity-free state during a ballistic curve in a jet plane. The use of a plastic squeeze bottle revealed no difficulties. However, drinking from an open container produced a mess of water bubbles in the face and surrounding area.

•

Dr. William M. Sinton of the Smithsonian Astrophysical Observatory recently reported on a new test to determine whether there is vegetation on Mars. This test is based on the fact that all organic molecules show strong absorption bands near $3.4\ \mu$, the wave length of the carbon hydrogen resonance. Spectra of Mars taken during the 1956 opposition indicate the probable presence of this band. Although the lichen spectrum was used for comparison, the similarity between them, of course, does not imply that lichens are present on Mars; it indicates only that organic molecules are present. According to Dr. Sinton, it seems unlikely, however, that "organic material would remain on the Martian surface without being covered by dust from storms, or being decomposed by the action of solar ultraviolet, unless they possess some regenerative power." These studies, therefore, support the Martian vegetation hypothesis. A strong regenerative power was first postulated by Dr. E. G. Oepic in the IRISH ASTRONOMICAL JOURNAL in 1950.

An outspoken promoter of the Martian vegetation theory is G. Tikhof of Russia's Alma-Ata Observatory, and a member of the Academy of Sciences in Moscow. Tikhof bases his opinion primarily on his findings regarding the ability of plants to survive in severe climates, such as in the subarctic, on the Pamir plateau, and to reflect and absorb infrared light in the blue-green areas on Mars. However, his scientific colleague, Olga W. Troizkaja, also a member of the Russian Academy of Sciences, in a paper published in 1952, expressed the opinion that only anaerobic, very cold-resistant microorganisms are conceivable in the severe Martian climate.

Another Russian astronomer, the well-known Professor W. G. Fessenkow, flatly rejects the whole theory of life on Mars in toto. There is apparently no party line in opinion so far as extraterrestrial cosmic matters are concerned.

Aircraft Nuclear Propulsion at Marquardt

by
Roy E. Marquardt
President

Aircraft Nuclear Propulsion projects now underway in ASTRO, a Division of Marquardt Aircraft, offer engineers and scientists challenging opportunities in a variety of technical fields. Here, where we are dealing with development problems on high-performance systems with stringent design and reliability requirements, creative engineers and scientists will find real challenge and opportunity for accomplishment.

Project personnel are currently working in such fields as radiation shield design, aerothermodynamics, control system design, instrumentation research, stress analysis, and neutronics. Problems range in scope from preliminary performance analysis through design of test facilities.

Experienced engineers and scientists capable of making contributions in these and related fields are invited to investigate the employment opportunities at Marquardt. You will find a combination of significant, active projects and a lively interest in new ideas, creating the environment for professional growth. Please address your inquiries to Jim Dale, Professional Personnel, 16555 Saticoy Street, Van Nuys, California.

Why not buy fully proven size 8 synchros? Clifton Precision size 8 units have been designed, developed, in production 2 years and are now being built into field equipment tested and accepted by end-use agencies.

Such acceptance made it necessary for us to establish another plant in Colorado Springs to produce size 8 synchros.

Accuracies not exceeding 7 minutes max. of error are guaranteed.

A full line of size 8 rotary components is available including AC and DC motors, linear transformers and motor generators.

For full information write or call Sales Department, SUnset 9-7521 (Suburban Philadelphia) or our representatives.

special features

Space conditions in the laboratory. Metal sputtering by ion bombardment duplicates high-velocity bombardment of satellites in space by atmos and molecules.

Dr. G. K. Wehner of the General Mills Electron Physics Laboratory describes some of the methods used to lengthen the mean free path of atoms used in sputtering experiments (p. 195).

The new look in ballistic-missile stabilized platforms. A description of the internally gimbaled platform.

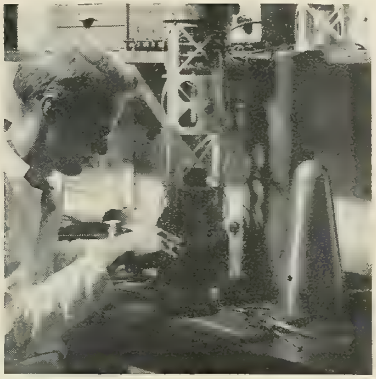
Army Ballistic Missile Agency philosophy stemming from early work in Peenemunde is described by the Deputy Director of the Guidance and Control Laboratory, ABMA, F. K. Mueller (p. 199).

Environmental limits of solder connections. Some considerations on a subject largely taken for granted.

Alvin B. Kaufman, chief development engineer of the Arnoux Corp. provides for the solder user, background material underlying the fundamentals of reliable military usage (p. 201).

Astrionics 193

cover picture:



Clifford J. Finnie of the Jet Propulsion Laboratory, Cal Tech, assembles interior instruments used in the Explorer *into the fibreglass lattice sleeve which forms part of the satellite. The two transmitters used to telemeter information are on either end of the mounting sleeve. One transmitter was of relatively high power and lasted only 12 days, but the low-power unit has an estimated life of two to three months. The now defunct transmitter, operating on 108.03 mc, sent data on the skin temperature of the rear area of the satellite, internal temperature, micrometeorite impact and cosmic-ray counts. The low-power unit, operating on 108 mc, telemeters information on the skin temperature of the satellite forward area, the nose-cone temperature, micrometeorite impact and cosmic-ray counts. The transmitters were designed as independent units from batteries to antennae so that malfunction of one would not affect the other.*

missile electronics news

Details of *Jupiter*-C Guidance System Revealed

by Raymond M. Nolan

NEW YORK, N. Y.—At a recent meeting here, scientists from the Guidance and Control Laboratory of the Army Ballistic Missile Agency discussed the guidance aspects of the *Jupiter*-C satellite launching vehicle.

Dr. Walter Heussermann, chief of the Guidance and Control Laboratory, demonstrated the orbit of the satellite with a world map and a transparent overlay. As he was speaking, he showed the exact position of the *Explorer*.

Questions brought out the fact that the *Jupiter*-C was stabilized in roll and yaw by an LEV-3 gyro system (see m/r February, "Workhorse of Inertial Guidance"). This probably means that the guidance system which put our satellite into orbit comprised an LEV-3 for roll and yaw, a Ford Instrument air-bearing gyro for the critical pitch control, and air-bearing gyro accelerometers for velocity and distance determination.

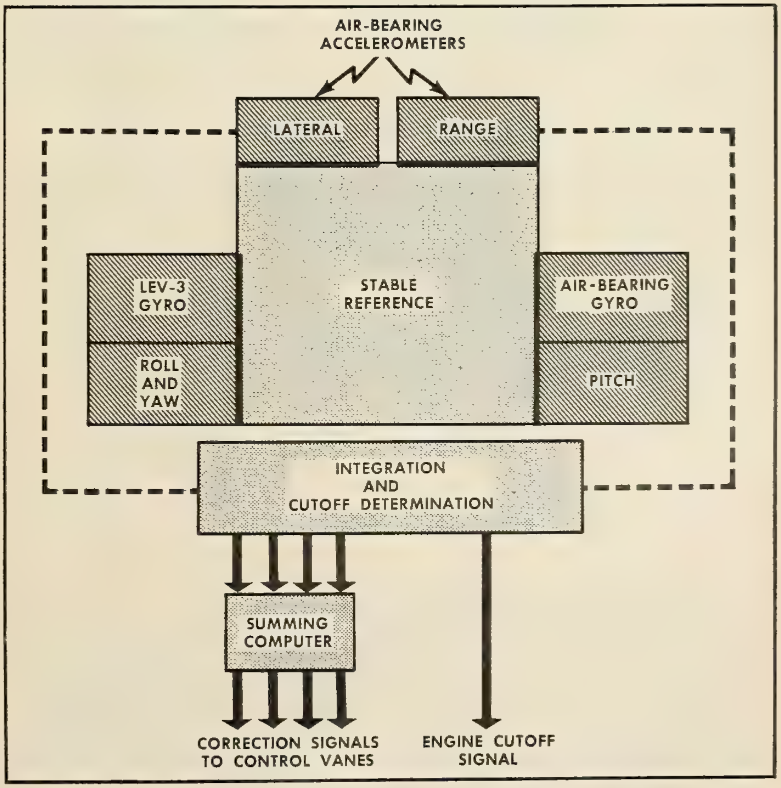
The use by ABMA of an LEV-3 in the system points to a decided difference in the *Jupiter*-C and the *Vanguard* programs. The LEV-3, a comparatively cheap device manufactured by the Waste King Corp., was developed by the same team that put up the *Explorer*—Dr. Wernher von Braun and associates—in World War II for the German V-2 missile. Development of the air-bearing gyros and accelerometers began even before that with early development work in the mid-1930's at Darmstadt Technical Institute.

In contrast, development of the guidance for the *Vanguard* presumably began in 1955 when the decision to drop Project *Orbiter* and proceed with *Vanguard* was made.

The guidance system of the *Jupiter*-C was in existence as a package for quite some time and required only installation and simple check-out when the word finally arrived that *Jupiter*-C could be launched.

Dr. Heussermann pointed out that, in spite of repeated criticism that the air-bearing instruments are delicate and difficult to produce, they are in fact extremely rugged devices and produce no more manufacturing difficulties than any reasonably complex instrument. No such criticism was voiced about the LEV-3 since it is obviously an easily produced, low-cost item.

An interesting statement made by Dr. Heussermann was that the guidance system on the *Sputnik* vehicles was probably more sophisticated than that on the *Jupiter*-C. He surmises this



Probable guidance and control system for the JUPITER-C first stage.

GIANNINI AC OUTPUT ACCELEROMETER

Wide Dynamic Range
Extremely Low Threshold
Low Null

ACCURATE, CONSISTENTLY RELIABLE AC output, proportional to linear acceleration, is provided by this new Giannini accelerometer. Available in ranges from ±1 g to ±20 g, the instrument has a full scale output of 6 volts which may be fed directly into a relatively low impedance with little or no phase shift.

NULL VOLTAGE IS 0.015 VOLTS, of which at least 90% is harmonic, assuring a wide dynamic range for the instrument. With a basic threshold sensitivity as low as 0.0001 g/g, input accelerations on the order of 0.0017 g's will provide a 10 millivolt change in output.

NO COULOMB FRICTION IS EXHIBITED in this design, bearings are eliminated by suspending the mass between two disc springs. Acceleration inputs move the magnetically damped mass, causing a proportionate change in the output voltage of a differential transformer. Cross-talk effect is minimum (0.003 g/g at 10 g cross acceleration on a 1g instrument); repeatability and hysteresis are below thresholds of measuring equipment.

IDEAL SECOND ORDER SYSTEM RESPONSE is achieved in the Model 24614 by magnetic eddy-current damping. The hermetically sealed instrument is oil-filled for stability of output under vibration. Specially designed and constructed for use in critical airborne control, stabilization, and flight test applications, the instrument is readily adapted to telemetering.

Giannini measures & controls:

ω	β	θ	ψ	τ	ν	ϕ
δ	Ω_c	α_i	h	P	ΔP	T
T_s	P_s	Q_c	M	T_o	P_T	TAS

since we have to spin our final three stages for stabilization while the Russians presumably have some self-contained stabilization device for their final stages.

The *Jupiter*-C upper stages are spun because all stabilization is lost when the upper part of the vehicle is pitched into a position horizontal with the earth. This would tumble any sort of gyroscopic stable reference and require that further stabilization come from some other source.

Mr. Fritz Mueller, also of the Guidance and Control Laboratory, stated in answer to another question that the gyros were smaller than those ordinarily used in a *Redstone* missile (the first stage of the *Jupiter*-C). This could mean that they are of the same type used on the *Jupiter* missile since it was announced previously that the *Jupiter* guidance and control system was essentially a miniaturized version of that used on the *Redstone*. If so, this might mean that the *Jupiter* guidance problem has been licked.

Based on remarks by Dr. Heussermann and Mr. Mueller, the accompanying sketch shows the probable makeup of the guidance and control system in the *Redstone* missile, which formed the first stage of the *Explorer* launching vehicle. The system is pure inertial but might have had a radio link to accomplish the final tilt to place the last three stages in a horizontal position.

In operation, the LEV-3 and air-bearing gyros stabilize a platform on which the two accelerometers—for measuring range and lateral translation—are mounted. The accelerometers deliver signals to computers for further integration and summing. Final outputs of the system are the cutoff signal to the main engine and vane control signals.

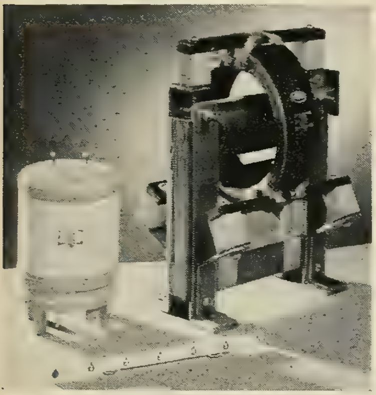
The only departure from the inertial systems used on the *Redstone* and *Jupiter* missiles (which use air-bearing gyros and accelerometers) is the inclusion of the LEV-3 as a stabilizing element. Since the LEV-3 has been available for such a long time, it is probable that the guidance system for the defunct Project *Orbiter* was identical or at least similar to the one used on the *Jupiter*-C.

New Cooling Techniques Lead to Miniaturization

Startling reductions in the size and weight of transformers through the use of new cooling and insulating techniques have been announced by the Raytheon Manufacturing Co.

The new techniques fall into two broad categories. In the first, heat resulting from unavoidable losses in cores and coils is carried away by the use of a volatile, heat-stable, fluorochemical liquid which boils on contact with heated areas. The vapor formed by boiling condenses when it contacts the cooler surface of the container, completing the cooling cycle. Heat transfer coefficients up to 20 times those attainable with conventional transformer oils are readily achieved.

The second technique makes use of stable fluorochemical vapors up to 50 times the weight of air. These vapors are characterized by excellent heat-transfer characteristics (equal to or better than oil), high dielectric breakdown strength (equal to oil at one atmosphere, better than oil at high pressure), and unequaled corona-suppressing properties.



Comparison of size between miniaturized transformer using air as a dielectric and new unit using heavy fluorochemical vapor.

Cooling effects better than those obtainable in oil are obtained by each of these two techniques.

Weight reduction in some cases has been as great as 75 per cent, an impressive figure in view of the amount of weight that transformers contribute to missile electronic equipment.

Norden-Ketay and Solar Aircraft Merge

The combination of Norden-Ketay Corp. of Stamford, Conn., a designer and builder of complex electronic systems and instruments, and Solar Aircraft Co. has been approved by the boards of directors of both companies. The transaction will be submitted to the shareholders at an early date, Paul Adams, chairman of the board of Norden-Ketay, announced.

The basis of the transaction would be the issuance of approximately 230,000 shares of Solar common stock, subject to contingencies. Norden-Ketay has approximately 1,300,000 common shares outstanding and is listed on the

Individual Initiative and Coordinated Teamwork

One of the unique characteristics of the Jet Propulsion Laboratory is its ability to provide a high degree of individual initiative and responsibility for its outstanding staff of engineers and scientists. At the same time each man is fully aware that his personal contribution is part of and keyed to the whole integrated teamwork of the Laboratory on all aspects of entire missile systems. This is an important preference factor in the choice of JPL as a work activity center.

The research and development contract on which JPL works with the U.S. Army Ordnance Corps has many ramifications and requires a constant search for new approaches to modern technical problems. This exceptional activity provides unusual career opportunities for qualified individuals.

American Stock Exchange. There are currently 700,052 Solar common shares outstanding, listed on the New York Stock Exchange.

Mr. Adams also released 11 months' figures for Norden-Ketay showing sales of $25,213,724 and a loss of $1,107,667 after interest expense and other deductions. The year-end audit is proceeding and further loss adjustments are indicated.

In a letter to Norden-Ketay stockholders, Mr. Adams stated: "Your company was hard hit by Government contract rescheduling and the receipt of virtually no new production business while the defense effort was being appraised. Serious reduction of working capital occasioned by the losses made it imperative that we seek substantial additional capital funds in order to preserve our status and maintain the potential of our company."

Solar's sales in the fiscal year ended April 30, 1957 were $83,118,500 and indicated sales of Norden-Ketay in the year 1957 were approximately $27,000,000. Solar is a major designer and manufacturer of products made from stainless steel and other hard-to-work metals. Products include aircraft and missile engine assemblies, airframe assemblies, small gas turbine engines, industrial expansion joints, and a variety of other military and commercial items. Norden-Ketay's output is largely used in aircraft and missiles, radar and fire control systems, and automation equipment.

Solar has plants in San Diego, Calif. and Des Moines, Ia. Norden-Ketay has plants and laboratories in several eastern cities and in California. The combined employment of the two companies approximates 6300.

NPN Computer Transistors Now Being Mass-produced

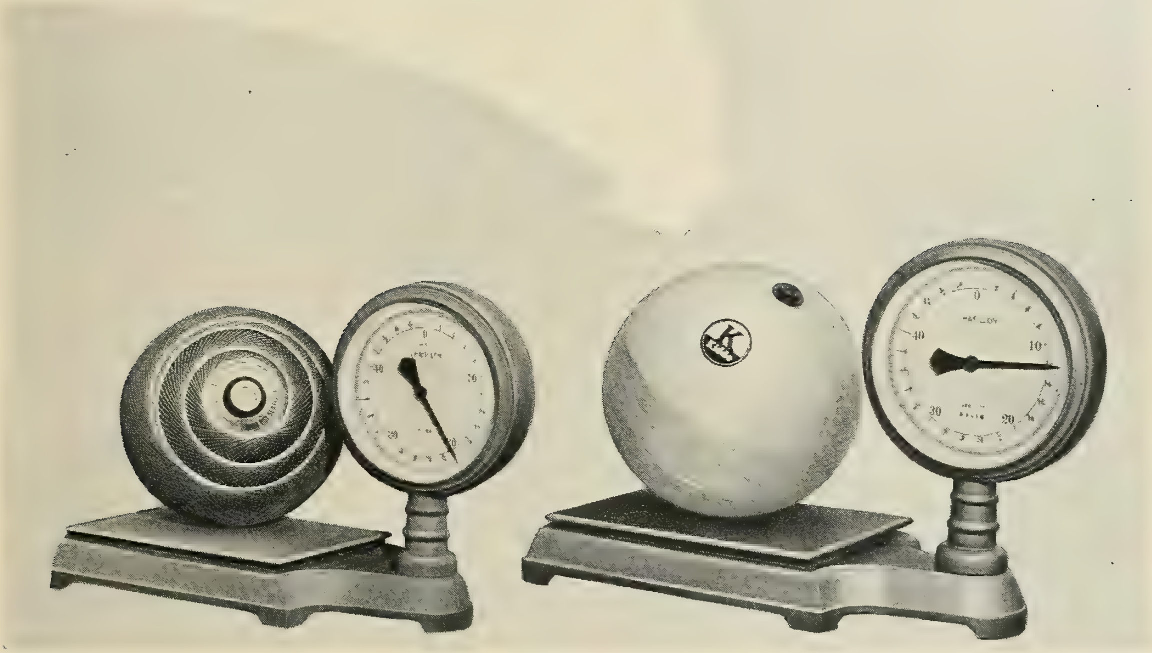
A new advance in production techniques resulting in the availability of substantial numbers of high-speed switching computer transistors was recently announced by Allan Easton, vice president of the marketing division of General Transistor Corp.

Mr. Easton said, "While we have been producing high-speed switching computer-types for a long time, no large-volume production was scheduled until we were making highest quality transistors with good yields." He went on to state that the increased availability is especially important because NPN computer transistors will now be available in large quantities.

In conclusion, Mr. Easton stated that he expected advanced development effort would bring similar results on newer transistor types.

STRONG AS STEEL...

but 40% lighter!



Shatterproof air-storage spheres by Kidde!

Pressurized air containers — strong enough to handle pressures up to 5000 psi, yet 40% lighter than their steel counterparts — have been perfected by Kidde aviation engineers.

Now available in volumes of from 50 to 5,000 cubic inches, lightweight Kidde spheres retain their physical characteristics at the higher temperatures encountered in today's high-speed missiles. Made of fiberglass wound on a non-porous liner, Kidde spheres are fabricated on Kidde-designed winding machines which laminate the fiberglass strands in a scientific pattern which equalizes stresses. A special epoxy resin binder gives firm support to the strands and permits the making of a 650 cubic inch, 3,000 psi sphere weighing only 12½ pounds, as compared to an equivalent steel sphere of 20½ pounds.

Lightweight fiberglass spheres represent a tremendous stride toward weight reduction without loss in strength.

In other air-storage applications — especially where portability is of prime importance—Kidde spheres afford the same weight-saving advantages. They are the strongest lightweight containers of their kind on the market today!

For more information about Kidde spheres and how they may solve your compressed air or gas problems, write Kidde today!

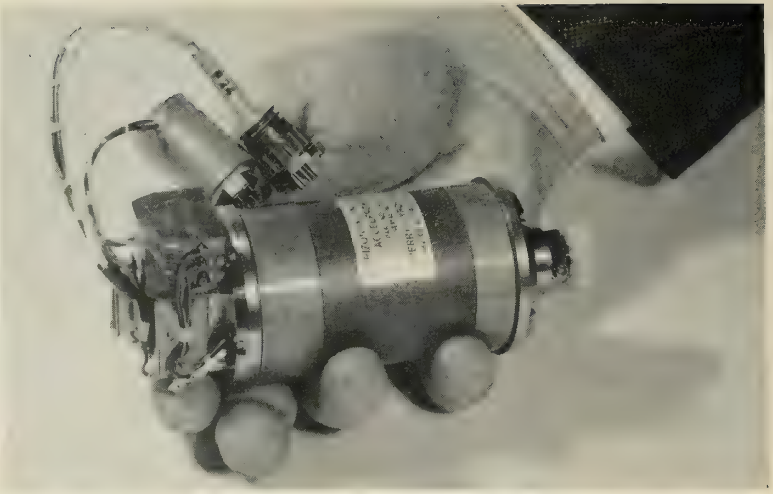
Sperry Shows Improved Type of Gyro Suspension



Sperry Gyroscope recently revealed details of a radically new form of suspension for integrating gyros. Rather than a pendulous weight (as in many precision accelerometers by offsetting the gyro rotor), the Sperry unit suspends the sensing element in a silicone fluid and then spins sensor and fluid while the accelerometer is operating.

Three small metal cylinders, self-contained, form the device. Smallest internal cylinder is the floating sensor or acceleration-sensitive element. This is immersed in a silicone fluid inside the next larger cylinder, which in turn is supported by bearings within the outer shell or case.

Inside the silicone fluid, the sensor would normally rise to the top of the liquid, except that the middle cylinder is spun at 1000 rpm by a small external motor. This rotates the silicone fluid as well, and produces hydrostatic forces that exactly center the inner sensor away from adjoining walls without any bearings at all.

Because the sensor is supported only by a spinning liquid, no static friction remains and the slightest component of acceleration along its longitudinal axis moves the sensor along this axis for precise electronic measurement.

As fluid is displaced from one end to the other by a piston-like action of the sensor, it exerts a viscous restraint on motions of the sensor. The use of special bypass tubes eliminates the possibility of variations in this restraint as the float moves. This combination cushions fore-and-aft movement in a manner that produces internal velocity which is exactly proportional to external accelerations.

Weight of the unit is one and one-half pounds; the size is illustrated by the accompanying photograph. Accuracy was conservatively quoted by W. G. Wing, head of components engineering at Sperry as "within hundredths of one per cent." He stated that threshold sensitivity was better than 10^{-5} g's or 100,000th the force of gravity. An example of this is the ability of the new

"Special" Versions of Standard Switches

HAYDON 6100 SERIES SWITCHES

Unusual switching problems do not always require expensive solutions. The "special" switch shown right, for example, is basically an "upgraded" version of a standard Haydon hermetically sealed miniature switch. In missiles and rockets, where subminiature switches must do a big job, the No. 61191—rated at 10 amps—will function consistently under environmental extremes. Unlike unsealed switches, Haydon Hermetically Sealed Switches maintain their ratings at all altitudes.

Specifications	Standard (6100)	"Special" (61191)
Contact Gap, min.	.015	.035
Operating Force, max.	9 oz. or 22 oz.	32 oz.
Release Force, min.	3 oz. or 6 oz.	6 oz.
Differential Travel, max.	.0005—.005	.012
Overtravel, min.	.007	.007
Electrical Ratings, 30 Volts D.C.	3 amps, Inductive 5 amps, Resistive	10 amps, Inductive 10 amps, Resistive
Life at Rated Load (actuations)	100,000	10,000 (Inductive) 25,000 (Resistive)

Haydon 6100 Series Switches are available with a wide range of characteristics and can be used with a variety of Haydon standard actuators, such as those shown at the left. Haydon also provides a complete design and development service to solve your problems in hermetically sealed switches and suitable actuators. For further information, write for data on the Haydon No. 61191 Switch.

AERO-POT*
miniature trimming potentiometers
featuring extreme reliability!

All-metal case gives maximum rigidity, ruggedness and long life, plus high resistance to impact and torque. Settings are stable under vibration of 30 G's from zero to 2000 cps...under acceleration, shock and ambient temperature changes. Excellent heat dissipation and protection against high humidity, splashing and dust. Zero end resistance.

The Aero-Pot is adjustable throughout 32 turns by means of a slotted leadscrew. Resistance range: 100 to 100,000 ohms in one case size. Can be supplied completely sealed. Write for literature.

Wherever you require high power, consider

DELCO HIGH POWER TRANSISTORS

Thousands of Delco high power germanium transistors are produced daily as engineers find new applications for them. In switching, regulation, or power supplies—in almost any circuit that requires high power—Delco transistors are adding new meaning to compactness, long life and reliability.

All Delco transistors are 13-ampere types and, as a family, they offer a collector voltage range from 40 to 100 volts. Each is characterized by uniformly low saturation resistance and high gain at high current levels. Normalizing insures their fine performance and uniformity regardless of age. Also important—all Delco transistors are in volume production and readily available at moderate cost.

For complete data contact us at Kokomo, Indiana or at one of our conveniently located offices in Newark, New Jersey or Santa Monica, California. Engineering and application assistance is yours for the asking.

accelerometer to detect the gravity force produced by tilting its sensitive axis as little as 2 seconds of arc—approximately the angle you get by raising a one-and-one-half-mile-long rigid pipe only one inch at the farther end.

Mr. Wing sees immediate application for long underwater voyages such as those preparatory to firing a *Polaris* missile. This might mean that the accelerometer would be used in a version of the Sperry SINS (Shipboard Inertial Navigation System) now in use on the USS *Compass Island*. The SINS was originally developed for the fleet ballistic missile version of the *Jupiter* missile and is presumably being used for the *Polaris*.

Simplified Data-handling for Wind Tunnel

A new data-handling system, capable of handling information from a total of 300 strain gauges and 100 thermocouples with an accuracy of better than 0.25 per cent of full scale, has been put in operation for wind-tunnel testing by the systems division of Beckman Instruments.

In high-speed automatic scan, the system samples 400 transducers at a basic rate of 400 per second. It is possible to vary the sampling period from one complete scan per second to one per 100 seconds.

In single-scan operation, the system makes a complete scan only in response to the operator pressing a button. Another feature is the capability of selecting any one of the 400 transducers and obtaining a graphic plot of the individual channel.

Input circuitry of the system has several unusual features. Transducer inputs are multiplexed into 10 per amplifier so that 40 amplifiers are used rather than 400, reducing the maintenance problem. Synchronized electronic and mechanical switching is used, including oil-immersed stepping switches capable of more than 300 million operations before failure. Solderless wiring and gold-plated contacts are used to eliminate noise and thermal effects from the low-level signal paths.

Extensive modular construction is used to aid in servicing and minimize down time. Input amplifiers are all plug-in units and the high-speed electronic commutator is easily removed for service.

The system uses an analog-to-digital converter to change transducer outputs into computer inputs. The converter compares the analog trace to a linearly changing voltage which calibrates itself against internal reference voltages 1000 times per second, the digitalization time.

The digital information is stored on magnetic tape and transferred to punched cards by means of a transistorized tape-to-card converter. Besides test data, all identifying information such as the date, time of sampling and the channel group number is recorded. Also, an analog signal is available for use with an X-Y plotter.

Neatest feature of the system is a servo control "gun" for rapid balancing of the strain-gauge transducers. The operator places the end of the "gun" over each balance control knob and the device automatically rotates each knob in search of a null position which balances the strain-gauge network. The trigger of the "gun" automatically switches the balancing circuit to the next network.

A system such as this points to the trend to a larger number of data channels, say engineers of the systems division, and additional multiplexing of amplifiers may be the answer. Future demands for systems capable of operating at the rate of 10,000 to 20,000 channels would require rack arrangements of tremendous size, but further advances in the art of solid-state amplifiers will probably be responsible for a total size within reason.

FURNACE FOR MISSILES!

Brazed all-metal honeycomb sandwich saves vital pounds in high-speed missiles

HEAT AND STRESS RESISTANT materials are of vital importance in the exciting area of missile technology. Stainless steels and high alloys are the best bet to date for hot-speed applications—but the specific gravities of these materials present a problem. Solar advanced technology has helped solve this problem with all-metal honeycomb sandwiches.

Solite®—a steel and high alloy sandwich structure developed by Solar—is a brazed material of foil-thin ribbons bonded between metal skins. It is lightweight, has remarkable heat resistance at speeds approaching Mach 3 and can withstand pressures that would crumple unstructured metals.

Large new electric furnaces—the only ones of their type—were designed by Solar to braze the sandwich structures. In addition to stainless steel, various high alloys are used for the honeycomb cores, and research in the use of other metals is in progress. For more than a decade Solar has placed special emphasis on guided missile technology—developing new metalworking techniques for the missile age. Solar's versatile missile team is available *now!* For more information write to Missile Engineering, Dept. D-160, Solar Aircraft Company, San Diego 12, California. *Designers, developers and manufacturers of gas turbine engines, expansion joints and aircraft engine, airframe and missile components.*

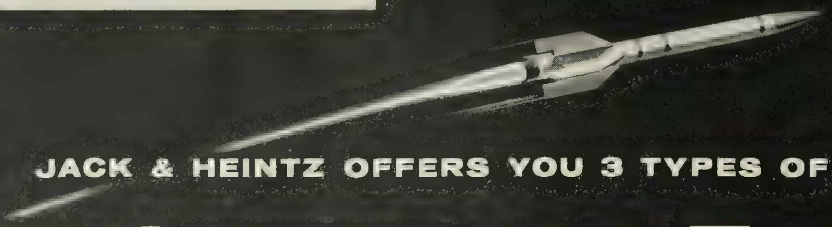
Missile Designers:



JACK & HEINTZ OFFERS YOU 3 TYPES OF

Environment-Free Generators

J&H machines deliver full-rated output independent of speeds, ambients, altitudes

In answer to the electric power needs of missiles, Jack & Heintz has successfully developed three approaches to the design of environment-free generators for such weapons. With many completed units within each classification, J&H is in a position to meet quickly the requirements of ICBM, IRBM and FBM missiles of all types: SSM SAM ASM AAM AUM UAM USM UUM.

Short-Duration Flights: J&H *thermal lag* generators are capable of delivering full-rated output throughout flight without benefit of cooling.

Long-Duration Flights: J&H *vapor-cooled* and *oil-cooled* generators using water and engine or hydraulic oil as coolants will deliver full-rated output regardless of speeds, ambients or altitudes.

Representative J&H Generator Designs for Missiles	Vapor-Cooled 	Oil-Cooled 	Thermal Lag J&H Model	G188-5	31190-005	31186-001
Nominal Rating (kva)	30	40	10
Duty	continuous	continuous	intermittent

Astrionics

by Henry P. Steier

Latest round of satellite-scurrying occurred just before the Army put up its *Explorer* satellite. Last minute additions to the Minitrack tracking stations were needed. A few days prior to the event, word went out to prepare for installation of special recording equipment to handle signals from the *Explorer*. This was needed for a different mode of signal from Army's "Microlock" position-fixing system developed by Jet Propulsion Laboratory some time ago for Army satellites.

•

Despite our success in getting a satellite up, a very important part of the program is still dragging its feet—installation of tracking cameras. From these was supposed to come the really precise observation of satellites, and accurate data on what they were doing. So far only two of 12 planned cameras are available. One is at White Sands Proving Ground, the other is en route to the Union of South Africa. Industry sources say mechanical problems are delaying production.

•

Optics job for the cameras has been called "one of the most difficult optical production jobs ever attempted." However, this work is on schedule. Optical design calls for a 31-inch Schmidt-type mirror and three aspheric corrector plates. Perkin-Elmer Corp., Norwalk, Conn., has contract for this work.

•

Real breakthrough which permitted start of radar detection system for ICBMs was development of high-powered transmitters, according to Lt. Gen. Donald A. Putt, Asst. Chief of the Air Staff for Development. A $721-million program involving Radio Corporation of America, General Electric Co. and Western Electric Co. was revealed by Putt in testimony before the House Appropriations Committee. Detection radar configuration is still cloaked in security. The other radar, for tracking after target acquisition, is similar to the Millstone Hill, Mass., radar prototype now being operated by Lincoln Laboratory of MIT.

•

Heart of the radio frequency power system employed in the tracking radars is said to be 11-foot klystron tubes which supply signals to the 84-foot-diameter parabolic reflector used. Tube is believed to be the X626 ceramic-metal tube built by Eitel-McCullough, Inc. It delivers 1¼ million watts peak power and 100 kilowatts average power. Frequency of the system is believed to be near the lower end of the spectrum usable for radar.

•

Detection radar must be a whopper from hints dropped by Putt in the testimony. Radar antennas must be located at some distance from the power-generating plant. It was implied that strong interference generated in the powerplant's vicinity would interfere with radar's operation.

•

Primary job of the ICBM detection system will be to make rapid computations of the missile's trajectory and find the predicted impact point. Computer will be of small size and transistorized. Sylvania Electric Corp. revealed it is a major subcontractor of RCA for the super radar, and will be responsible for the data-processing phase of the warning system. According to estimates, 15 minutes warning time is about what the system will give. That's not enough to evacuate many people, but ought to be enough to get an anti-missile missile on-course for interception.

HEATING BLANKETS

and Other Woven Heating Elements

by Safeway

for MYRIAD USES

Inherent in the rapid, unremitting advance of present-day technology is a growing need for accurately controlled delivery of heat in many industrial and military applications. SAFEWAY heating blankets or woven-wire heating elements can be designed specifically to fill countless of these needs. Indicative of their broad potential are the diversified purposes they are already serving with complete success.

◆

In the field of missiles and rockets, fuels, propellants and launchers are kept at operational temperatures with controlled heat.

Airframe manufacturing utilizes heating blankets for both honeycomb and metal-to-metal bonding.

Component aircraft parts . . . gyros, cameras, computers, servos, batteries, antennas, to name just a few . . . must be heated when exposed to the freezing environment at the altitudes at which jets fly. Also needed at low operating temperatures are de-icing units for propellers, wings, vertical fins and horizontal stabilizers.

Apparent, too, is the marked growth in the usage of heating blankets to satisfy winterization needs and demands of certain types of refrigeration units for satisfactory defrosting methods.

If it has to be heated (and the "it" can be just about anything), you can rely on SAFEWAY engineers to study your problems and — without any obligation — submit an appropriate recommendation.

WINTERIZATION

metal sputtering by ion bombardment

basic research
for tomorrow's metals

by G. K. Wehner

WHEN METEORS go hurtling through space and collide with a planet, they leave huge craters on the planet's surface. And when sandblasting is used to clean the grimy surfaces of metropolitan buildings, particles of the surface being cleaned are knocked loose along with the grime.

In each case, a solid surface is altered by the *impact* of the "particles" striking it.

Likewise, the basis of *sputtering*, as the term is used by physicists, is the alteration of a solid surface caused by the impact of striking particles. In the study described here, the bombarding particles are ions of mercury gas which are made to strike a metal surface. The impact causes surface atoms of the metal under study to be ejected. Under prolonged ion bombardment metals literally are disintegrated.

One of the objectives of working on sputtering in the laboratory is to set up and investigate conditions similar to those which exist in outer space. In this outer space an object like a satellite encounters collisions with free-wheeling atoms and molecules. Such collisions are capable of knocking loose atoms of even the best metals we now have. This is one of the reasons why the sputtering investigations are significant—in providing basic data in the search for materials that will withstand the atom and ion bombardment at high velocity flight in the ionosphere and in outer space.

These conditions generally can be duplicated by putting the target metal in a chamber which contains an ionized gas at reduced pressure. The ions, accelerated under the influence of an electric field, bombard the target surface and sputter the target metal.

To one unfamiliar with this work, the equipment used for these sputtering studies appears to be a complex arrangement of glass chambers and tubes.

The phenomenon of sputtering by ion bombardment has been known for a long time. It was first recognized on cathodes in gas discharge tubes and mentioned as cathode sputtering in an English publication as early as 1852. Current work was started at Wright-Patterson Air Force Base, Ohio.

Besides paving the way for the development of metals for high velocity flight, the purpose of the project is to understand the sputtering phenomenon thoroughly, providing necessary data for further work in such fields as gas discharge studies, crystallography, surface physics, metallography, etc. In other words, the work fits the category of basic research—creating basic scientific knowledge for use in a potentially great number of applications.

Until recently one of the major obstacles to detailed sputtering work was that the mean free path of the bombarding ions was too short. (The "mean free path" can be defined simply as the average distance that the ions travel without hitting anything.) That is, when the bombarding ions were released from their source and directed toward the target metal, many of them struck gas atoms and were reflected off in various different directions.

To make headway in learning about sputtering, it is necessary to know the exact bombarding energy that the ions impart when they strike the metal, and the angle at which they strike. This is impossible when many of the ions are bouncing from one gas atom to another in the chamber rather than traveling a direct route from the source to the metal.

To lengthen the mean free path of the ions, therefore, the obvious answer is to reduce the gas pressure (increase the vacuum) in the chamber so that there are fewer gas atoms to collide with the ions in their flight to the target metal.

Reducing the gas pressure also solves another problem. That is, at the *higher* gas pressure, many of the atoms that are sputtered from the surface of the target metal collide with gas atoms and are reflected back to the target metal. With this happening there is no way of knowing accurately the *rate* of sputtering, and the yield of sputtered atoms deposited on the chamber wall is greatly reduced. Indeed, it seriously interferes with learning how a certain metal withstands ion bombardment.

To eliminate such problems, the gas pressure is decreased to a level (10^{-3} mm of mercury or less) where by the sputtered atoms are allowed to travel freely from the metal to the collector, or the chamber walls. At this level, the *unobstructed* flight distance of the ions going toward the target metal is greater than the dimensions of the chamber. Sputtering then becomes independent of the tube geometry and gas pressure.

To provide the bombarding mercury ions with the essential high velocity, it is necessary to impose an external potential difference between the mercury ions and the metal target. In the present studies the target metal is given a negative potential to attract the positively charged bombarding mercury ions.

A difficulty which has had to be solved in this research is that oxide layers of some metals are more resistant to sputtering than others. Even when they are thoroughly removed before the metal is placed in the sputtering chamber, oxide and other such layers may be reformed continuously during the sputtering process. This occurs

---

Dr. Wehner is associated with the General Mills Electron Physics Laboratory.

either through impurities diffusing from the bulk of the metal to the surface or because of impurities from the gas settling down on the metal surface. Even with the pressure of impurities in the tube at an extremely low level (10^{-6} mm mercury) a complete layer one atom thick would be formed on the surface of the metal in one second if every atom of the impurities stuck to the surface. Therefore, the ion bombardment would have to compete with the formation of such interfering surface layers.

Obviously, if oxide layers were allowed to build up on the metal, they would complicate the sputtering conditions. It would be impossible to get precise, clear-cut data on pure metals.

So, a basic requirement for reliable sputtering measurements is that the density of the bombarding ion current be high enough to overcome the formation of surface layers. Ion beams in a high vacuum are normally limited to a very low current density. Under such conditions each surface atom of the target metal receives only one impact every 100 seconds.

In the work at General Mills, a method employing a *vacuum arc discharge* has been developed which increases the current density by more than a thousand times—about 10 impacts per surface atom per second—even at a low gas pressure. At such high current densities weighable amounts of metal can be sputtered off in a reasonable time even when ions are striking at relatively low speeds. Thus it is possible to collect reliable sputtering data in the region of low velocities of the bombarding ions (30 to 400 electron volts), a region which has never been thoroughly investigated.

An analogy might serve to illustrate why this low velocity region is of much interest: If a slate wall is "bombarded" with bullets, it is chipped, pitted and otherwise marred in a rather haphazard fashion. But if the wall is eroded by the lower velocity of wind-driven sand, for example, the gentle erosion or etching pattern reveals structural details quite clearly.

A certain minimum velocity of the bombarding particles is necessary before sputtering will occur. In fact, charged atoms, or ions, are used rather than neutral atoms because ions can be more easily accelerated to the required velocities.

In an effort to simplify sputtering conditions in the current work, metal single crystals, rather than polycrystalline metals, are used as targets. (Metal single crystals are metals "grown" in such a way that the arrangement of the atoms is regular and identical throughout the whole piece. Polycrystalline metals consist of microscopically small crystallites which are randomly oriented.)

The use of metal single crystals as targets revealed the surprising discovery that when metal atoms are sputtered they are not ejected from the surface randomly but leave in certain directions determined by the *arrangement* of the atoms in the crystal. In other words, the atoms of the target leave the surface of the crystal in directions of closely packed rows, or lines formed by atoms lying directly against each other.

Heretofore it was widely held that sputtering resulted from heat caused by the impact of ions on the metal atoms. (Surface atoms of metals *can* be ejected by heat. This is called evaporation, or sublimation, and is not to be confused with sputtering.)

It has also been shown in the present work that sputtering will not occur unless the bombarding ions have a critical minimum kinetic energy—threshold energy—for any one metal.

In studying the threshold energy requirements for many different metals, a surprising result is that the velocity of sound in the metal comes into play. That is, the threshold energy for a given metal is related to the manner in which the metal transmits sound energy vibrations from one atom to another. Thus, it turned out that threshold measurements provide a simple method for measuring sound velocities in metals.

It can readily be seen that sound velocities are important in sputtering when one considers that surface atoms are ejected by a vibration from *within* the target metal. The momentum of the impact of an ion is directed to the interior of the target metal. This momentum is then *reversed* in a certain way by the bulk of the target metal, and travels most efficiently along a row of closely packed atoms to the surface where it ejects the surface atom at the end of the row.

Other interesting, applicable results of sputtering are the etch effects observed on target metals after ion bombardment.

As a tool in studying structures of metals, controlled sputtering has the advantage over chemical etching of being equally applicable to almost all metals. Also, it involves only two parameters—kinetic energy of the bombarding ions and target temperature.

The naturally occurring arrangement of the metal atoms into a perfect lattice becomes deranged because of slight impurities, and heating, molding and machining of metal processing. When these out-of-place atoms are jarred free by sputtering, some of them, along with other loosened atoms, find their way back into the natural lattice, or pattern, of the metal.

When the ion velocities used in

the present work are converted from electron volts to miles per hour, it may be seen that the region of the lowest velocities studied here is of the order of the velocity necessary to hold an earth satellite in its orbit. Also, the density of the gas at altitudes above 100 miles is so low that the mean free path of the gas atoms is very large. These atoms and molecules actually bombard the satellite surface with the flight velocity of the satellite. For many metal and gas combinations this velocity is above threshold, especially at the sides of the satellite "target" where the incidence is oblique and the thresholds are low. Under such conditions the sputtering rate should increase with the fifth power of the velocity.

Hence, such sputtering effects should be much more pronounced and even detrimental at those velocities suggested for interplanetary "spaceships" of the future.

Although many details of the sputtering process need further clarification, it can be assumed that the basic picture is about as follows: The atomic weight, kinetic energy and angle of incidence of the target atoms determine the amount of momentum and energy that is transferred to the surface atoms of the target. The momentum pointing to the inside of the target must be reversed in direction in order to account for sputtering. This reversal takes place inside the target and a sound pulse travels from the place of impact most efficiently along closely packed atom rows. In this part of the process the sound velocities come into play.

Finally, a surface atom receives an impact from one of its close neighbors underneath, with the momentum directed to the outside. If the energy of this impact is sufficient to overcome the binding energy of this atom, and if neighboring atoms do not interfere with the direction of ejection, the target atoms clear the surface and are sputtered. The process is markedly different from evaporation and the influence of the target temperature is of only a secondary nature.

Efforts in General Mills' present sputtering work are now concentrated on:

1. Collection of more yield and threshold data, especially for gases other than mercury.
2. Continuation of ejection studies from metal single crystals.
3. Simulation of erosion conditions arising in high-velocity flight in the ionosphere and in outer space.

The final goal is to arrive at a thorough understanding of the basic phenomenon of sputtering.★

A report to engineers and scientists from Lockheed Missile Systems—
where expanding missile programs insure more promising careers

LOCKHEED ENGINEERS DEVELOPING TRANSISTOR FLIGHT CONTROLS FOR POLARIS

Lockheed engineers are testing and developing transistor flight control systems for the Polaris ballistic missile program. Transistorization of missile control systems has been receiving top attention at Division laboratories in Palo Alto and Sunnyvale. Advantages of transistor designs over present systems include reductions in weight and space requirements.

Flight control activities cover synthesis and analysis of systems; development or procurement of necessary hardware; bench and systems testing of complete control systems; specifications of required flight test programs; and analysis of actual flight tests.

Division scientists and engineers are making many significant contributions that earn Lockheed leadership in missile development. Through their efforts, our Polaris has become the first and only solid fuel strategic ballistic missile program.

As greater emphasis is placed on missiles' role in U.S. defense, our missile projects will continue to grow. This means more career positions are open for qualified engineers and scientists—positions that offer unequalled opportunities for you to move ahead rapidly.

In addition to **Flight Controls,** openings are in: **Electronics, Information Processing, Ground Support, Reliability-Producibility,** as well as **Guidance, Propulsion, Aerodynamics, Thermodynamics, Systems Integration, Human Engineering,** and **Structures.**

Qualified engineers and scientists are invited to write M. W. Peterson,
Research and Development Staff, Palo Alto 7, California.

the new look in gimbal systems

internal gimbaling tailormade for ballistic missiles

by F. K. Mueller

> Ed. Note—*Recently published pictures of* Thor *and* Jupiter *stabilized platforms (m/r, February) point to a basic difference in concept. The* Thor *platform, like most units with unlimited travel in all three degrees of freedom (as in aircraft, land and sea applications), is gimbaled from the outside in, while the* Jupiter *platform departs from convention by gimbaling on a central core (from the inside out). Here, the Deputy Director for Guidance and Control, ABMA, gives some of the reasons why ABMA chose to develop this type unit. The May issue of m/r will carry an article written by AC Spark Plug engineers detailing their reasons for using the externally gimbaled platform.*

WHEN GYROS were first employed for attitude reference in navigational systems, gimbal suspensions were built to satisfy the requirements of the airplane, ship or land vehicle on which the reference was to be used. None of these vehicles presented operational stresses to the gyro support systems much more stringent than the stationary condition. However, as a disadvantage, they had the requirement of unlimited maneuverability in one or more of the three coordinates. The designers' answer was to arrange two or three gimbal rings around the gyros, and thus the classic external gimbal illustrated in Fig. 1 came into being.

Ballistic missiles upset this neat arrangement by posing a whole new set of problems—weight, high linear acceleration with its vector changing direction and magnitude (presenting in turn the problem of isoelasticity), and vibrations of undetermined frequencies and magnitudes.

During World War II, the inertial guidance system, development of which began with the A-5 missile in 1937 in Peenemunde, was improved for use on the V-2 missile in order to replace the V-2's original autopilot and missile-fixed integrating accelerometers.

The stabilized platform for this guidance system consisted of three gyroscopes, two integrating accelerometers and two plumbline detectors, supported by a conventional external gimbal system. Although the platform had to operate only during the propulsion period—slightly longer than one minute—all the other typical ballistic missile criteria had to be met.

Early in the development stage it became apparent that a high percentage of overall platform weight would have to be allotted to the gimbal structure to cope with stresses due to vibration and linear accelerations in the order of 6g. So, an important problem was to find the most favorable gimbal ring structure. Investigations resulted in the decision to build hollow steel gimbal rings formed from sheet metal and welded together as shown in Fig. 2.

The hollow box frame gimbal was found to be superior to solid aluminum-alloy rings not only in the matter of weight, but also in respect to yield under stress.

This design, after completion and successful flight-testing, was the first stabilized platform specially designed and built in large quantities for a ballistic missile. The completed unit still featured the traditional external gimbal system. This was a workable, reliable system but studies throughout the

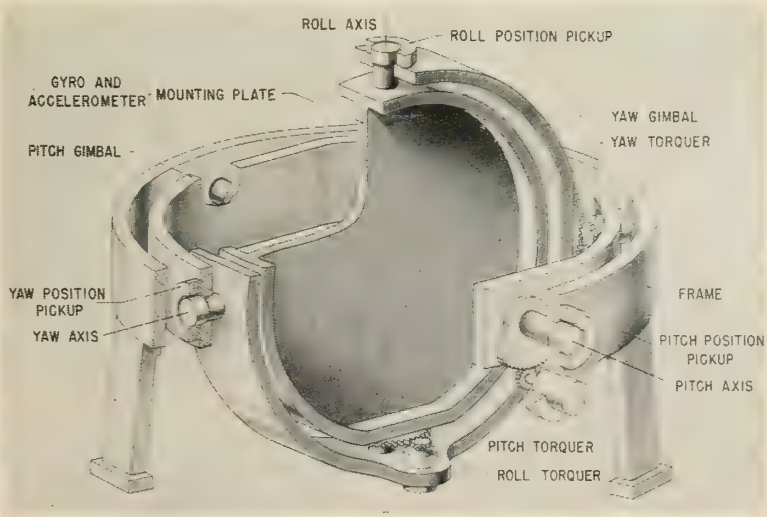

Fig. 1—External Gimbal System. Outer gimbals enclose gyros, accelerometers and other sensing elements.

Mr. Mueller is the deputy director of the Guidance and Control Laboratory, Army Ballistic Missile Agency.

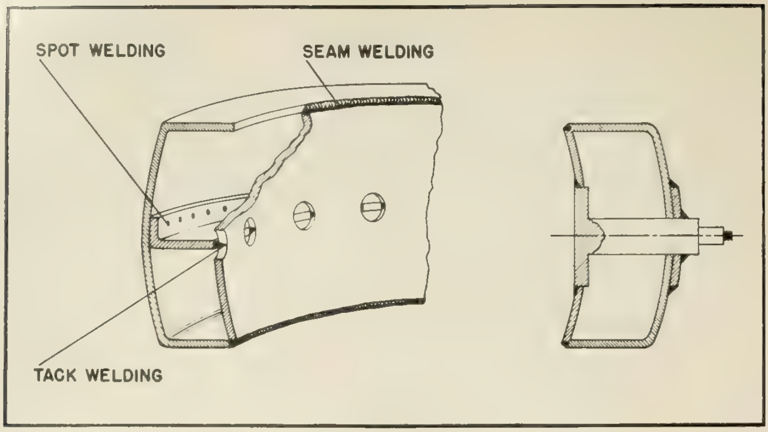

Fig. 2—Gimbal Ring Section. V-2 missile used stabilized platform fabricated in this manner.

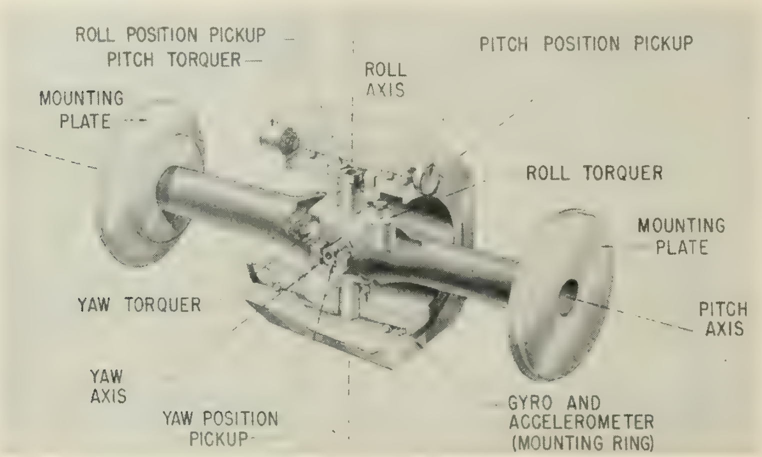

Fig. 3—Internal Gimbal System. All sensing elements are mounted on the outer gimbal ring.

years showed that, while the weight-efficiency ratio was acceptable, it would have to be improved for faster and higher-flying missiles.

A stabilized platform normally carries three types of sensors—gyros for stabilization, accelerometers (or integrating accelerometers) for guidance information and plumbline detectors for prelaunch alignment. Considering the gyros, accelerometers and plumbline detectors as the sensing components and all the other remaining elements such as gimbal rings, torquers, housing, etc., as structural components, a weight-efficiency ratio can be established:

$$\frac{\text{weight of sensing components}}{\text{weight of structural components}}$$

This ratio provides a convenient basic criterion to judge the suitability of a stabilized platform for a ballistic missile. In the case of the V-2 stabilized platform, a weight-efficiency ratio of 1:4.2 was achieved. Modern missiles with higher linear accelerations and more severe vibration can be expected to decrease this ratio even further. The size and the weight of the sensing components are mainly determined by accuracy requirements: the logical way to improve the ratio is to reduce the size and weight of the structural components.

The realization that a more favorable suspension mode was necessary provoked a long series of design and development studies by Army Ordnance and the Army Ballistic Missile Agency. These studies resulted in the internal gimbal system, tailormade for ballistic missiles. The internal gimbal system breaks with the tradition of building the gimbal around the gyroscopes and instead concentrates the kinematic features of the three-axis gimbal system into the smallest volume possible and places the sensing components on the outermost gimbal itself as illustrated in Fig. 3.

By this method stabilized platforms were produced for conditions more severe than those of the V-2, but actually attained weight-efficiency ratios of 1:1.4. After the first system of this type was built, further studies and tests, including flight tests, confirmed most of the anticipated advantages.

The overall weight and space requirements of a stabilized platform with an internal gimbal system can be kept smaller than one with external gimbals using sensing components of comparable size and weight.

The arrangement of the sensing components on the outermost gimbal makes them very accessible for calibration and maintenance and permits easy exchange of components.

The internal gimbal system features relatively rugged parts with small lever arms which results in relatively small elastic deformation under stress. This results directly in higher natural frequencies.

The simplicity of the gimbal parts permits a design of utmost isoelasticity. The importance of isoelastic features is clearly indicated by the relation for a disturbance torque, T, created by nonisoelasticity:

$$T = m^2 g^2 y \left(\frac{X-1}{Y}\right) \sin 2\alpha$$

where the mass m of the sensing components and the acceleration g appear in the second power. X and Y represent the yields in the direction of the axes of the gimbal system and α the angle between the direction of acceleration and direction of the gimbal axes. The rectifying effect of the g^2 term makes the vibration forces especially difficult to cope with. Such torques caused by linear acceleration and vibration have to be compensated.

The inner gimbal configuration results in a relatively small inertia around the stabilized axes. The ratio between this moment of inertia and the angular momemtum of the gyro influence the configuration of the servo loops. (See "How Industry Solved the Air-bearing Gyro Stabilization Problem," m/r, February.) The smaller moment of inertia permits simpler servo loops and smaller torquers.

The internal gimbal system has limited freedom in two of its axes and permits 360° freedom in one axis only. However, limited freedom in two axes is not a limitation in common ballistic missiles which require 360° freedom in one axis only.

The system is not suited to accommodate direct or ungeared torquers but again, this is not a disadvantage. On the contrary, an optimized gear ratio with its associated small torquer, amplifier and power supply can be built with only a fraction of the weight of its counterpart, the ungeared with its amplifier and power supply.

The internal gimbal system can be applied to save considerable weight and space in any vehicle which tolerates limited gimbal freedom in two axes.★

soldering in the missile age

modern applications cause new look at old techniques

by Alvin B. Kaufman

WITH TODAY'S technology advancing by leaps and bounds, the subject of solder connections is largely taken for granted and rarely accorded the importance that it deserves. The engineer is thus overlooking an important reliability parameter.

It is conventional practice among engineering writers to review the "literature" when compiling and writing a text or article to clarify or advance the "state of the art." Careful perusal of all available MIL specifications, handbooks and trade journal literature has revealed an abundance of material on soft (tin-lead) solders.

Unfortunately, review of this multitude of material has indicated redundant data which is incomplete insofar as supplying the engineer with environmental limits of the solder materials and terminal connections with which he must work.

The literature is also meager on the subject of soldering fluxes and soldering techniques. In general, however, certain publications appear to outline accurately the uses of various solders and fluxes in the electronic field. For this reason, very little mention will be made here of basic solder-flux data and soldering techniques.

Rather, this article provides for the solder user a sound and factual background underlying the fundamentals of "environmental limits" as applied to the realities of solder usage.

The environmental parameters with which the engineer must be concerned, surprisingly enough, are much broader than mere temperature or tensile strength limits. Additional parameters are methods of wire or component-solder termination or configuration, vibration, shock and effects or combinations of these conditions.

Solder fluxes are tested for cor-

How KENNAMETAL* helps to send it on its way

Seal rings in pumps handling red fuming nitric acid for rockets face a most severe test against corrosion, especially since they may be in contact with the acid for years before being required to operate.

In one particular assembly, rings were exposed to temperatures of 300° under 45 psi face pressures while rotating 17,500 rpm. The previously used material lasted approximately 120 minutes. Then rings made of Kennametal grade K501 were installed and one of the world's leading designers and manufacturers of aircraft components and systems, reports average life of the Kennametal rings as "over 120 minutes to indefinite."

They state that "the Kennametal rings sealing results have been far superior with no indication of seal face wear" and that "the Kennametal ring has indications of less bending and distortion when installed between two mounting faces making assembly simpler and reducing assembly time."

This is only one of the dozens of instances in the development of missiles and rockets where getting a design off the board and into the air depended on finding materials with unusual properties. Kennametal has been usually successful in filling these needs, providing not only corrosion resistance, but heat and abrasion resistance, also.

Why not get full information . . . and, if you wish, recommendations as to which Kennametal type would best fit your particular needs. Just write KENNAMETAL INC., Dept. R, Latrobe, Pa., and ask for our new 12-page Kentanium booklet.

rosion and fungus resistance per MIL-S-6872 and MIL-E-5272 respectively. The solder or its connection receives "environmental test" only incidentally during the test of equipment, as solder procurement specifications require composition and plastic or melt point certification only. Climatic environmental conditions are normally evaluated by test per MIL-E-5272A.

This specification includes testing for items such as sand and dust which are not applicable for solder reliability tests. Other parameters such as humidity, temperature, and salt spray are dubious in value. Temperature in particular is a factor in which adequate control has not been made.

Components are rated per MIL specification for environmental temperatures of 85°C with little attention paid to the associated solder connection with which the component is held in place. Additionally, I^2R heat generated in, or radiated by components may well bring solder connections close to the solder "plastic" range. Military specification MIL-R-26B indicates that power resistors at full ratings may have surface temperatures of 200-350°C (392-662°F) in free space and still air. Coupled with this is the possibility of higher than ambient internal air temperatures due to enclosure of an assembly in a rack panel or in its placement in a marine or airborne vehicle.

For the reasons indicated above, careful empirical tests to evaluate the "connection" or the use of higher temperature soft solders is advisable. It can thus be seen that cooling of equipment or solder connection parameters must now be considered as a prime design requirement, and electronic equipment must be thermally designed as well as electronically designed.

In either case, the use of an eutectic alloy solder where practical is desirable. An eutectic alloy solder is one in which there is no appreciable "plastic" or semimolten state; *i.e.,* a few degrees of temperature separates its solid and molten state.

This solder has an advantage in preventing a "cold" solder joint such as will occur by accidental mechanical movement of a lead wire while the solder is cooling down through its "plastic" range. The non-eutectic solder may have a plastic range of 50 to several hundred degrees (Fig. 1). This type of solder is commonly known as a "wiping or body" solder. As such it has many uses not connected generally with electronic soldering.

Fig. 2 indicates the comparative strength of tin-lead solder vs. alloy ratio. Note that at the 50 to 60 per cent tin ratio to lead, the highest strength alloy occurs.

These solders, however, are not

necessarily as strong as other solders at elevated temperatures, as shown in Fig. 3.

Although certain material and word of mouth indicate that 230°F is the limit of a soft (tin-lead) solder connection, no published data has been found to substantiate this claim. Fig. 3 clearly indicates the tensile strength of soft and low-temperature silver solders at various temperatures.

This data in itself is not enough to indicate a "safe" solder-termination temperature. According to one reference, "the alloy attachment lies in the this film of solder between the two metals joined together." In addition, the reference indicates that it is advisable to make a mechanical joint for strength, using the solder mainly for electrical conductivity.

At one time the author would have agreed with this statement without exception and under certain high temperature conditions this statement may still be correct. However, with the introduction of shock and vibration parameters, the picture is radically changed.

A termination, in which the component lead is held to its associated binding post by solder alone, has proven superior in resisting vibration and shock and in ease of component replacement. The test parameters included the use of tin-lead solders of various ratios, but unfortunately did not include tests of the solder joint above 200°F. This is approximately 161°F below the plastic point of tin-lead solders.

The plastic point is considered by the author to approximate zero tensile strength. With a solder joint at 200°F, considerably lower environmental temperature would have to be assumed for anything but a passive or low level power device. The solder in such a termination, at this moderate temperature, would still have approximately a 3000 psi tensile strength. For commonly used 50-50 solder, this corresponds to a 50 per cent decrease of tensile strength.

At a 300°F joint temperature (combination of 85°C (185°F) environment temperature and I^2R from a power resistor) such solder has decreased in tensile strength to about 1100 psi.

It is obvious then that, depending on component-terminal geometry, a mechanical connection or a higher temperature soft solder becomes essential at this time. The mechanical connection however does not allow the solder joint to be taken to the "plastic" solder temperature. Under vibration, at some point, solder integrity would fail due to stress transfer or outright "throwing" of solder. In addition, more rapid failure under vibration stress would occur. It appears that the solder-held termination is still superior, although it introduces a requirement in some cases for the higher temperature soft solders.

The tensile strength data shown in the graphs is not assumed to be highly accurate. Solder-alloy tensile-strength data available to the author shows a correlation of approximately 20 per cent.

Variation in this data will be found from source to source due to measurement technique variation and impurity variation between test samples. Also, tensile strength may be based on strength of the solder alone or its holding strength in relation to copper, tin or various solderable elements.

The high-temperature limitations presented above may also be altered by another effect. Certain material indicates that alloy composition changes with a temperature gradient. Correlation of this effect with tensile, bending or torsional stress is not known.

As of this time its significance to the soldered joint has not been de-

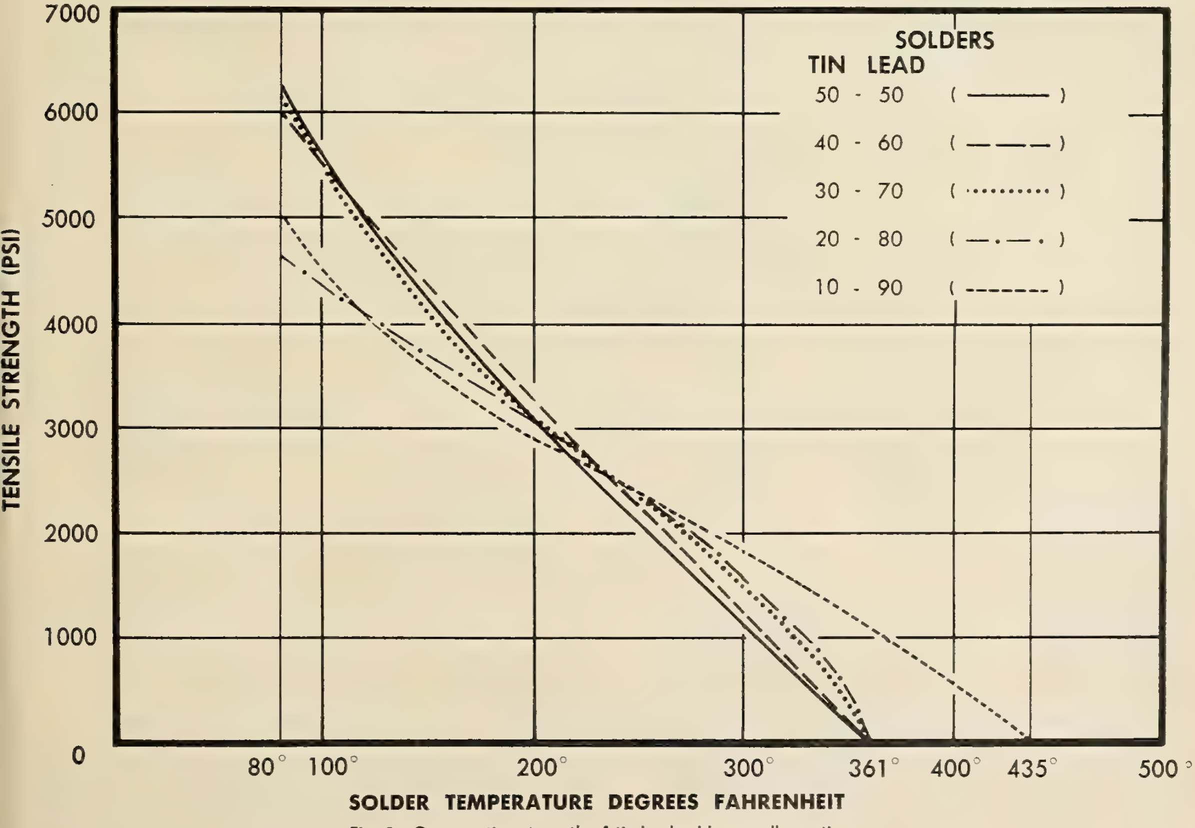

Fig. 2—Comparative strength of tin-lead solder vs. alloy ratio.

Complete new bulletin on Instrumentation cables now available

Here's a brand-new comprehensive source of information on cables for telemetering, data recording, circuit control testing, and electronic computers.

Now you can avoid leafing through a dozen incomplete references when you want information on instrumentation cables.

You'll find all the pertinent data in one concise, eight-page bulletin, Rome Cable's RCD-400.

We've drawn on our own considerable experience with instrumentation and telemetering cables to give you the story on multiple conductor designs, insulating and jacketing materials, color coding, as well as charts listing various MIL specs.

Even this bulletin cannot answer all your questions, of course, but it will help you block out problems and areas where you want more information. You are then invited to ask for more specific data.

This new bulletin is easy to get. Just send the coupon for your *free* copy.

* Tin (Sn) first figure; lead (Pb) second figure.

§ Eutectic alloys do not have a plastic range, but have a sharp and distinct melting point; *i.e.*, there is little or no distinguishable difference in temperature between the solid and liquid point.

veloped. It is well, however, to keep this parameter in view in regard to its possible ultimate effect in changing solder environmental limits.

Much attention has been paid to the upper environmental temperature limits. The lower or colder environmental limits also deserve their share of attention. Experience with solder in arctic areas has indicated that solder connections maintained for long periods at cold temperatures are subject to failure. This is due to the tin content in the solder.

Push temperature down and lead's strength goes up, with little loss in its ductility. Not so with tin. Below −18°F tin may suffer its allotropic transformation, to a brittle element. The lead-tin soft solder alloy becomes gray and crystalline in form with resultant open or erratic conductivity. Recent research shows that lead-tin solders tend to split the differences noted above in rough proportion.

A 50-50 solder, for example, produces joints with higher tensile strength at −75°F than at room temperature. But it is more brittle. At −75°F the solder is still stronger than the joined metals. At colder temperatures the solder is weaker.

Increasing the lead content of a solder lowers the temperature at which joints retain good ductility. Ease of soldering decreases, however, and the strength does not increase as rapidly as temperatures go down. Up to 15 per cent tin content has little effect on ductility. Beyond 15 per cent the loss in ductility and the lowering of impact and fatigue resistance should be considered when specifying a solder for "cold" environmental applications.

Although antimony and other elements are generally considered worthless or accidental impurities of virgin metal solders, 0.2 to 0.5 per cent antimony in 40 to 70 per cent tin vs. lead solders inhibits the allotropic change. Higher values of antimony create a hard and brittle solder.

Of course one easy way to forestall this problem is a change to a lead-silver or other higher temperature soft solder alloy; providing its higher melting point and greater difficulty of application (with non-corrosive rosin flux) is acceptable.

The use of soldered connections close to liquid oxygen or helium tanks (such as in missiles) poses a severe problem as indicated above, if long-term connection stability is required. Environmental temperatures of −297 to −453°F respectively, may be encountered on the surface of such tanks. Air environmental temperatures close to such tanks may reach −100°F or colder.

In a recent typical missile system, with which the author was concerned, components were required to operate in a −200°F air environmental temperature. The use of high-temperature soft solders was indicated in the preceding paragraph but is not the only alternate possible.

Crimped, silver solder or welded connections are also feasible for some connections. Potting of components and terminal connections, especially where internal assembly heat is developed, may negate the requirements of special solders or techniques.

The use of tin-lead soft solders internal to liquid or gaseous oxygen tanks is not suggested. A number of tin-lead alloy solders have been tested and found sensitive to impact when in contact with liquid oxygen.

At present, if a tin-lead solder connection must be made in the vicinity of liquid oxygen, it is recommended that it be sheathed in teflon tubing to prevent direct contact with the liquid or that other alloy solders be used. Note that an impact is required as the "ignitor" to cause an explosion, and that this is not too probable in most installations. In addition, some teflons

REPUBLIC VALVES

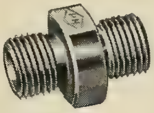
THAT FILL YOUR NEEDS

MINIATURE CHECKS

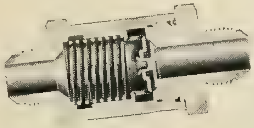


Mini-Valve

FREE FLOW
5000 P.S.I.

Regular Size Valve

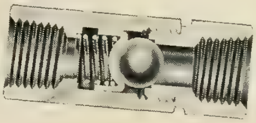
Save weight and space with Mini-Valves. They have same rated flow as regular size, but are only ¼ the size and weight. Good pressure drop characteristics. Temp. range −65° to plus 400°F. Operating pressure to 5000 psi. One-piece stainless steel body, in tube sizes 4 to 16 (¼″ to 1″ O.D.) Meets or exceeds requirements of MS MIL-V-25675. Port threading MS33514 flareless.



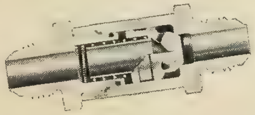
FREE-FLOW CHECKS

Extremely low pressure drop, with wide open flow. Molded elastomer seal and spherical seat prevent leakage at any pressure. Sizes ⅛″ to 2″ in brass and aluminum alloy up to 3000 psi, and stainless steel to 4000 psi. Opens at 2 psi. Temp. range −65° to 200°F. Pipe, internal straight thread and flared tube connections standard; MS33514 flareless available.

BALL CHECKS



Ruggedly constructed for intermittent non-shock hydraulic service up to 500 psi at temperatures −65° to 350°F. Sizes ⅛″ to ¾″. Brass, aluminum alloy, stainless steel. Pipe and flared tube connections.



HY-PRESSURE CHECKS

Built for continuous service in high velocity systems at pressures up to 5000 psi in steel and stainless steel, and 3000 psi in aluminum alloy. Low pressure drop. Metal-to-metal seal. Operating temperatures −65° to 250°F. Sizes ⅛″ to 2″, with pipe, internal straight thread and flared tube connections. MS33514 flareless available.

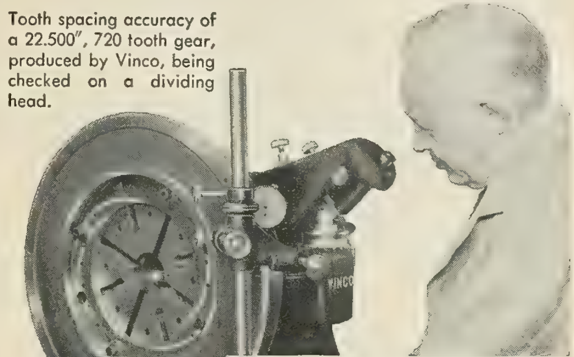
NOW, more than ever, the VINCO OPTICAL DIVIDING HEAD is needed for proving tooth spacing accuracy

Tooth spacing accuracy of a 22.500″, 720 tooth gear, produced by Vinco, being checked on a dividing head.

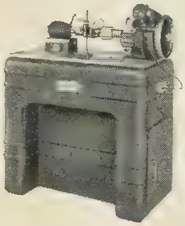


GEAR SPECIFICATIONS

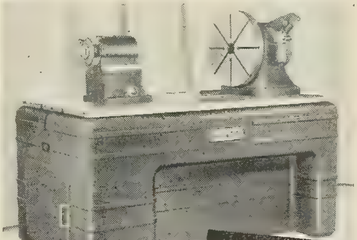
720 teeth; 32 diametral pitch; 14½° pressure angle; 22.500″ pitch diam.

Tolerances	Specified	Measured
Total composite error	.0006″	.00035″
Total index error	.0007″	.0002″

GUARANTEED ACCURACY—2 seconds of arc. SPINDLE RUNOUT less than 25 millionths of an inch. Such accuracy is a "MUST" as a final inspection authority on aircraft precision components, critical parts and assemblies of missile guidance systems, precision gear trains, index plates, cams, automatic controls, the calibration of involute checkers and master involutes. Either cast iron or granite surface plates available on Vinco dividing heads. All Vinco surface plates have a flatness accuracy within .0002″.



Model 55—38 is available either with a 20″ x 40″ surface plate; capacity between work centers 22″, or a 20″ x 72″ surface plate; capacity between work centers 54″. Both have a work swing of 12 7/16″ dia.



The heavy duty dividing head is built to handle work with a swing up to 24 7/16″ dia. Surface plate is 36″ x 72″. This model has the same accuracy as the standard model.

Send for brochure giving all details.

Vinco specializes in the contract manufacture of missile subassemblies, aircraft components, precision gears, splined parts

have been found sensitive to impact under the same conditions. More specific data is not available to the writer at this time.

Although temperature vs. tensile strength of solders has been thoroughly covered, it is not intended to infer that these are the only parameters involved in selecting a solder. The overall quality of a solder is governed by numerous factors. These are speed of alloy formation, flow (or wetting) of solder, chemical stability of the soldered connection, soundness and porosity of the joint, and physical resistance to shock, strain and stress. In addition, the requirement that corrosive-type fluxes be used with some solders may rule out their use, even though excellent in all other respects.

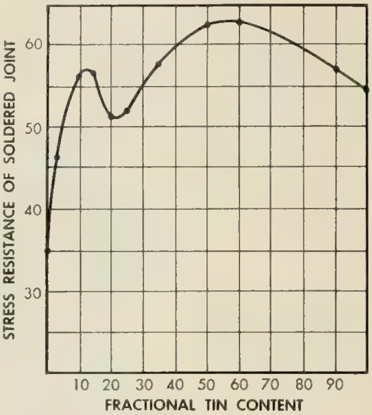

Fig. 3—Stress resistance of soldered joints vs. fractional tin content.

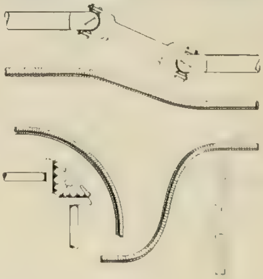
The primary purpose of the solder is to unite two or more metals in continuous metallic contact under environmental conditions as previously noted. Tensile strength in itself is not necessarily a complete index of quality, although Fig. 2 indicates a close corollary.

Other parameters of possible value are: Brinell hardness, elongation; torsion, bending, and compressive strength. Simulated bending-torsional stress or vibration-shock life tests will certainly have to be correlated under various environmental conditions to secure comprehensive design data for possible use in the future.★

The data in this article is not as comprehensive as could be presented, but it is hoped that it will contribute something of importance to the design engineer and additionally be a spur to greater investigation by other research agencies.

FLEXIBLE SHAFTING REDUCES GEARING



Flexible Shafting reduces the noisy and cumbrous gearing used in conjunction with solid shafts. It has the ability to transfer power from remote places, over, under, and around obstacles found in the path of installation between the drive and the driven units. Flexible Shafting requires very few parts, making them inexpensive; whereas solid shafts using universal joints, miter gears, and gear trains, many times would not be feasible because of their noisiness or lack of economy. With a Flexible Shaft assembly, design may be simplified and your engineering time spent on other necessary component parts without having to worry that they will create obstacles when placed where you want them.

Flexible Shafting cuts down on vibration thus offering long life with very little maintenance required. For complete Flexible Shaft information, write F. W. Stewart Corporation, 4311 Ravenswood Ave., Chicago 13, Illinois.

NEW *Harmeco* FILTERS

Pneumatic Type for Compressible Gases—Pressures to 6,000 lbs.

Harmeco Filters are available in various case designs to suit any piping requirement for filtering helium, nitrogen and other compressible gases at porosity ratings of 2, 5, 10, 20 or 40 microns or coarser. Interchangeable multi-tube sintered stainless steel wire wound elements or strainers are optional. Case is carbon steel forging; stainless steel, monel or other materials as specified.

ELEMENT MANIFOLD PIPE ASSEMBLY

Double tapered one piece Harmeco hollow sintered bronze disc elements provide deep uniform, dependable filtration. Spacing between the discs is uniform when assemblies are stacked and sealed in ported manifold pipe. One piece element design eliminates slip fits or organic bonding materials. The double tapered, hollow disc design prevents blocking off of surface area due to possible cocking of the elements on the manifold pipe. Result: greater filtering area; uniform porosity control; clean decontaminated products.

DATA PROCESSING SPECIALISTS

missile flight testing is a big business... bigger than ever before... and the Engineering Services Division of Telecomputing, with more than ten years of continuous and highly specialized service in this field, offers exceptional employment opportunities at Holloman Air Force Base, New Mexico.

This is an exciting business. At the White Sands Proving Ground Integrated Range missile tests are an everyday occurrence. We salute those who design and develop today's advanced missiles. Here, we are a part of the culmination of their work.

Our job is to compute the performance of missiles in flight. Our output—authentic, concise, and accurate reports—contributes substantially to the advance of the missile sciences, and enables the Armed Services and Missile Contractors to evaluate field performance. The need for rapid and accurate analysis and evaluation of data is greater than ever before. So, it follows that our people are not only abreast of the state-of-the-art in data processing, but, in a very real way, it is we who establish the state-of-the-art, and keep it constantly moving forward.

Specialists of the Engineering Services Division are associated with the use of the most modern scientific data measuring and processing systems—cinetheodolites, electronic measuring systems, telemetry, precision optics, and optical to digital converters. The output of these instrumentations are processed through the use of high-speed digital computers and other advance design data reduction equipment.

Make your home in New Mexico's land of enchantment • Mountain skiing and resorts just 30 minutes away • Attractive salaries with area bonus • Profit sharing • Relocation pay • Group insurance

Send your resume today to the Director of Technical Personnel:

people

Rear Adm. Jackson S. Champlin, USN (Ret.) has been appointed assistant to the director of DataTape Division of Consolidated Electrodynamics Corp.

A. C. Labrie has joined the consulting firm of Thomas Wilcox & Associates in Washington.

Myron G. DeFries has been named head of the chemistry group of Atlantic Research Corp., Alexandria, Va., and **Kenneth D. Johnson** has joined the firm as staff assistant to Vice President **Keith E. Rumbel.**

Richard N. Goldbach has been appointed to the newly created position of vice-president in charge of marketing for the semiconductor division of Hoffman Electronics Corp.

Dr. Theodore K. Steele has been named vice president of research and engineering and **Oscar Brockmeyer** has been named vice president of engineering sales for Bulova Research & Development Laboratories.

E. U. Da Parma has been appointed executive vice president of Sperry Gyroscope Co. He formerly was vice president for operations.

D. M. Heller and **R. E. Whiffen** have been appointed assistant general managers and **W. P. Bollinger** has been named director of engineering of the products division of Bendix Aviation Corp.

A. R. Teasdale has been named to the newly created post of director of advanced technology at Temco Aircraft Corp. He formerly was chief of avionics.

James S. Arnold, a physicist at Stanford Research Institute, has been elected vice president of the Northern California section of the American Rocket Society.

Five persons have joined the staff of recently formed Data-Control Systems Inc. in Danbury, Conn. **F. E. Farris,** now assistant to the president of the firm, was formerly with Philips Electronics Inc. as assistant sales manager. Others are **David Zeller** and **Joseph H. Marchese,** research engineers; **Owen J. Ott,** senior research engineer; and **Clark A. Denslow,** industrial engineer.

Charles H. Kenerson has been appointed eastern district customer relations manager in charge of Marquardt Aircraft Co.'s Dayton office. He succeeds **Paul J. Papanek,** who becomes assistant director of customer relations at the firm's main office.

Col. Frank M. Fazio has assumed command of the Air Research and Development Command's liaison organization.

Herbert C. Langmore has been named manager of special products for North American Aviation's missile development division. He has been project engineer for the X-10.

E. A. Bellande has been placed in charge of foreign operations and support services for the Garrett Corp.

Dr. Louis N. Ridenour, head of research for Lockheed missile systems division, has been appointed to the Air Force's Scientific Advisory Board.

Sud-Aviation Corp., a U.S. firm representing the French aircraft/missile manufacturer, has the following officers who are also directors: **Claude J. Teyssier,** president and treasurer; **Alexis C. Coudert,** vice president; and **George F. Mason, Jr.,** secretary.

George M. Ballee has been appointed vice president and director of sales for the Electro-Snap Switch & Mfg. Co.

ENGINEERS-
TECHNICAL PUBLICATIONS

An Important New Title at General Electric's Heavy Military Electronic Equipment Department

General Electric right now offers technical writers an opportunity for increased professional status and growth potential. Newly designated positions . . . *engineer-technical publications* . . . require above average technical competence for the preparation of instruction books and technical manuals for HMEE's complex military electronic systems.

ENGINEERS TECHNICAL PUBLICATIONS prepare creative manuscript for operations, training and field maintenance handbooks. Subject material includes circuit theory, systems philosophy, operation and installation of heavy radar, sonar, air traffic control, ICBM guidance systems.

ENGINEERS TECHNICAL PUBLICATIONS must have the academic and practical know-how to gather and document material through daily contact with design engineers, factory test, product service and manufacturing personnel, while interfering as little as possible with the normal daily work of these groups.

Requirements: • U.S. citizenship • Ability to secure SECRET clearance • BSEE or BS Physics or equivalent technical competence. • Field experience (e.g. military electronic equipment maintenance) highly desirable. • High talent in assimilation, organization and presentation of technical material.

Expense-paid interviews for qualified applicants. Please send your resume to Mr. George B. Callender.

**HEAVY MILITARY
ELECTRONIC EQUIPMENT DEPT.**

MISSILES
YOUR
GOAL?
DANGER

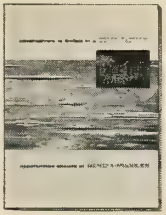
Get into a key missile program at BENDIX —prime contractor for the Talos missile

Engineering can be a really satisfying career—and within engineering one branch stands out. That's Guided Missiles. If the missile field is the one you want—hear this. We need engineers with exceptional ability who can handle responsibility.

At Bendix you work with men who are outstanding in every phase of engineering. You use facilities second to none. You do work that's challenging and important—work that offers exceptional opportunities to build your professional standing.

You will enjoy Midwestern living at Bendix, too. Fine, four-season climate and excellent recreational facilities are close at hand. In addition, Bendix offers you a liberal personal benefit program.

If this interests you and you want additional information, mail the coupon below for your copy of "Opportunities Abound at Bendix Missiles". You can read it through in half an hour—and it may prove to be the best half hour you've ever spent in your life.



Bendix Products Division—Missiles
412P S. Beiger St., Mishawaka, Ind.

Gentlemen: I would like more information concerning opportunities in guided missiles. Please send me the booklet "Opportunities Abound at Bendix Missiles."

GRADUATE EE'S: GENERAL ELECTRIC DISCLOSES HIGH PRIORITY PROGRAM FOR ATLAS

GUIDANCE SYSTEM. MANY POSITIONS OPEN IN ELECTRONIC MISSILE TECHNIQUES=

ACCURACIES ON ORDER OF 1 PART IN 10 MILLION

required for portions of G.E.'s ICBM ATLAS Guidance System

General Electric
Guided Missile
Control Facility
WS107A-1

Delivering an ICBM over a > 5000 mile trajectory into the target area demands a guidance system of unprecedented accuracy—and this is the calibre of the electronic system General Electric engineers are creating for ATLAS.

But achieving designated accuracies and reliabilities in the laboratory is not enough. *These high standards must be maintained in actual operational environments, with virtually no interruption or degradation.*

CAREERS IN STEP WITH THE FUTURE

Engineers who join the Missile Guidance Product Section of G.E. are doing more than hastening development of one of the nation's most urgent programs — guidance for ATLAS. As Manager of the Section Richard L. Shetler states: *"With this job behind us, there will remain no significant obstacle to the practical guidance and navigation of other space vehicles."*

PROGRAM ACCELERATION OPENS UP WIDE RANGE OF POSITIONS IN:

Systems analysis, evaluation & integration
Systems and component reliability
Transistorized circuits, pulse circuitry, IF-Video circuits
RF and Microwave components & plumbing
Communications control devices
Doppler radar design & development
Digital data processing techniques, data transmission involving D & D of ground-based & airborne antennae, transmitters, receivers; application of transducers, transponders, etc.
Test operations, including planning, range instrumentation & test execution; development & application of automatic test equipment

If you feel that your special skills and interests fit you to work in any of the above areas, why not write us in detail? Qualified candidates will be invited to visit our facilities to meet with technical managers and gain first hand knowledge of the living advantages of our locations at Syracuse and Utica, N. Y.

Write in complete confidence to Mr. E. A. Smith, Room 3-G

missile miscellany

Washington's beginning to come to life again: Army's General Daley recently quipped that "Now we've got a missile with a range of 400,000 miles a day." Jupiter-C, of course, and its Explorer payload. And Defense Secretary McElroy, in appointing GE's Roy Johnson to head up the new Advanced Research Projects Agency, said that he saw no reason for Johnson to sell his GE stock; that he couldn't see any conflict of interest. With hundreds of millions of dollars in defense contracts, of which a healthy hunk is missile and space-flight related, this page wonders just how Mr. McElroy would define "conflict of interest."

Then, there's usually cogent Assistant Navy Secretary for Air Garrison Norton, who recently told Congress that Jupiter-C was "very, very expensive and rather inefficient." If Vanguard manages to get its scheduled six 20-inch spheres into an orbit—which isn't at all certain yet—each will have cost the American taxpayer an absolute minimum of $18.3 million each. And, when we're all through, there isn't any other practical use for Vanguard. Any thought of using the complex beast as an IRBM is preposterous to contemplate.

In contrast, Jupiter-C was developed and paid for as an essential tool in the development of the intermediate-range ballistic missile, Jupiter. Similarly, AF had the X-17 for its Thor and Atlas development work. Jupiter-C as a satellite launching vehicle was a pure bonus to the taxpayer—its research and development cost having all been written off previously for military work. The bare bird itself—one Redstone plus 15 Scale Sergeants plus special engineering on the fourth stage—could not have cost more than $1 million, which seems to dump Norton's cost claims.

As for efficiency, the record speaks for itself. Vanguard is a two-and-a-half-year-old project. When Explorer went into orbit it was, as a satellite project, less than three months old. How do you define efficiency, Mr. Secretary?

If you've ever wondered really whether the missile business was big business or not, perhaps this little statistic will be a helpful indicator: Redstone Arsenal, Huntsville, Ala., used 7,531,258 kilowatts of electric power during December 1957.

Then, there was the case of Senator Irvin listening to General Schriever who finally stopped the ballistic missile general with: "Pardon me, General, but this sounds like unscrewing the inscrutable."

One authoritative estimate concludes that within 10 years Russia will have to launch 50,000 nuclear warheaded missiles at varying ranges in order to knock out all the West's retaliatory bases, assuming a 10-megaton H-bomb in each missile. Only a fraction of these would so poison the air with radioactivity as to destroy the population of the Soviet Union—and everybody else in the world as well.

And now quick and fast—Wandering about with Lockheed Missile Division engineers, this page learns that Thiokol, as well as Aerojet-General, will share in production of solid-propellant motors for Navy's Polaris fleet ballistic missile; that 16 will be carried in each submarine . . . Army's angling to build an ICBM based on an improved Jupiter . . . AF's in the mood to build a solid-propellant ICBM, perhaps using Thiokol Big-B technique to make a single-motor first stage . . . Astrodyne (Phillips-Rocketdyne) has sent a proposal to the AF to build up production of an improved MB-1 rocket to hundreds of units a month . . . The weight of destruction from missile nuclear warheads is now down to a point where it's less than half a ton per megaton.

For additional information about any product or service advertised or mentioned in the editorial pages of this issue of MISSILES AND ROCKETS:

Use the attached prepaid reply cards. Circle numbers shown on the reply card that correspond with numbers appearing beneath items described. If no circle number accompanies the article or advertisement, give page number (and advertiser's name) on line provided at bottom of the card.

Your requests for information will be forwarded promptly to the companies concerned.

NEW PRODUCT BRIEFS

ACCELEROMETER. A self-generating, dynamic accelerometer, capable of handling accelerations to 1000 g's has been developed. The unit is designed for applications where high-frequency transients or step-function inputs are expected, and operates over a frequency range of 3 cps to 60 kc. It has a flat response of ±6% between 5 cps and 40 kc. Acceleration range is from 0.01 g to 1000 g's. Acceleration of 5000 g's causes no damage and a 200-g steady-state acceleration will not affect specifications. Transverse response is 5% or less. Consolidated Electrodynamics.
Circle No. 239 on Subscriber Service Card.

PNEUMATIC VALVE. Dual-lever emergency pneumatic valve operates on an inlet pressure of 3300 psi and applies differential pressures from 0 to 1000 psi, depending on the force exerted through each of two operating handles. Weight is 2.4 lbs. Walter Kidde & Co., Inc.
Circle No. 240 on Subscriber Service Card.

FLEXIBLE COUPLINGS. Connection provides flexible coupling for miniature electromagnetic clutches and brakes. Made in 2 stock models and in 2 sizes for each model ranging from 15/16" o.d. to 1 5/16" o.d. for shaft diameter from 1/8" to 1/2". Dial Products Co.
Circle No. 241 on Subscriber Service Card.

POWER SUPPLY. Model KM93B silicon rectifier power supply provides a stepless controllable output of from 0 to 32 volts dc with a continuous-duty full-load rating of 40 amps. Ripple is held to within ½ of 1% throughout the range of the equipment. Safety factor allows for continuous operation at 125% of rated current. Cooling is by convertion. Voltage regulation from 1/10 load to full load does not exceed 12% at 32 volts output. Opad Electric Co.
Circle No. 242 on Subscriber Service Card.

HYDRAULIC TEST STANDS. Series KC-300 universal hydraulic test stands, providing performance data for all types of hydraulic system components and accessories, has been developed and is being produced by Kahn & Co., Inc.
Circle No. 243 on Subscriber Service Card.

AUTOMATIC COATING. Maximum control of heater wire coating used in the manufacture of electronic tubes is afforded by an automatic machine which controls the thickness of insulated coating applied to heater wire. The developer of the machine, Sylvania Electric Products Inc., is using it in production.
Circle No. 244 on Subscriber Service Card.

TRANSISTOR SOCKET. A new Teflon-insulated transistor socket for missile guidance and electronics applications is now available. The sockets, of compression-mounted design for assembly time and cost saving, are also suitable for subminiature tubes with in-line leads and are applicable to printed circuits. Fluorocarbon Products, Inc.
Circle No. 250 on Subscriber Service Card.

DIGITAL RECORDER. A digital recorder printing 11-column digital information at rates to 5 prints per second has been introduced. Primarily designed to make permanent record of electronic counter readouts, the device is also usable with two or more counters simultaneously, digital voltmeters, time recorders and flowmetering equipment and systems such as telemetering installations and engine test stands. In addition to the printed tape record, the instrument, model 560A, provides an analog current or voltage output to drive a galvanometer or potentiometer strip chart recorder or to provide a servo control. Hewlett-Packard Co.
Circle No. 251 on Subscriber Service Card.

PRINTED CIRCUIT CONNECTORS. PC board receptacles of one-piece body construction available in either type GR and MFE mineral filled phenolic, MDG diallyl phthalate or CFG general-purpose phenolic. Receptacles have new contact design to prevent board-to-contact damage. H. H. Buggie, Inc.
Circle No. 255 on Subscriber Service Card.

NYLON TUBE TRUNK. Flexible trunk consisting of color-coded nylon tubes clustered within tightly braided stainless-steel sheath. Available in lengths up to 1000 ft., lightweight, and handles high pressures. M & Q Plastic Products.
Circle No. 257 on Subscriber Service Card.

BALANCING MACHINES. A new line of Rava electrodynamic balancing machines has been introduced for production and short-run balancing. The machine employs an electrical measuring system and both the angle and amount of imbalance are determined by adjustment of electrical controls. Tinius Olsen Testing Machine Co.
Circle No. 258 on Subscriber Service Card.

FLEXIBLE AIR DIELECTRIC CABLE. Cable used to check out missile radio-frequency systems in preflight tests. Product forms closed circuit over which interrogation and response signals are transmitted on ground. Andrew Corp.

MISSILE LITERATURE

FUELS AND LUBRICANTS. Five reports of fuels and lubricants research conducted for the Armed Forces, including a study of the effects of gamma radiation on organic fluids, have been made available through the Office of Technical Services of the Department of Commerce.

Circle No. 200 on Subscriber Service Card.

MONITORING SYSTEMS. Remote-area monitoring systems are described in a 4-page bulletin covering basic units in the systems and giving specification data on ranges, response, accuracy, stability, dimensions, weights and suggested uses. Victoreen Instrument Co.

Circle No. 201 on Subscriber Service Card.

MICROMATION PRODUCTS. Plug-in servo repeater systems, subminiature servo amplifiers and other products are described in a series of file folders and specification sheets available from Waldorf Instrument Co.

Circle No. 202 on Subscriber Service Card.

ROTARY SEALS. A booklet describing the principle of retaining gases, oils or other liquids under pressure shows typical sealing problems encountered in machine design. The 12-page text is supplemented by illustrations and cellophane overlays. Rotary Seal Division, Muskegon Piston Ring Co.

Circle No. 203 on Subscriber Service Card.

LITHIUM. Facts and figures on lithium and other alkali metals are available in a 24-page brochure featuring charts and other illustrations. Covers principal sources, developed and undeveloped, in the world. Current prices, principal uses and producers are also covered. Montgary Explorations Ltd.

Circle No. 204 on Subscriber Service Card.

FOAM METAL. Development of techniques and equipment which produced a satisfactory metal foam for sandwich construction is described in this three-part report for the Air Force, just released for industry. Entitled "Foamed Metal Low Density Core Material For Sandwich Construction," the publication is available through the Department of Commerce's Office of Technical Services.

Circle No. 205 on Subscriber Service Card.

HIGH-TORQUE MOTOR. Design features, specifications, dimensional drawings, photos and exploded views of a new high-torque motor, described in a data sheet, are now available. Motor operates over a temperature range of −100° to 500°F at 60 or 400 cycles ac or pulsating dc. Starting and stopping time is a microsecond and starting torque is equal to running torque. Viking Tool & Machine Corp.

Circle No. 206 on Subscriber Service Card.

DIAL SCALE CATALOG. An illustrated catalog showing different types of dial scales and related accessories and specifications covering dial graduations, capacity, platform dimensions, and other data has been published by the Howe Scale Co.

Circle No. 207 on Subscriber Service Card.

INSTRUMENTS. Phase meters, impedance, vacuum tube voltmeters, amplifiers and numerous other instruments are described in a brochure covering the complete line of instruments produced by Acton Laboratories, Inc.

Circle No. 208 on Subscriber Service Card.

POWER TRANSMISSION. New concept in power transmission is detailed in a brochure citing it as being particularly suited to design requirements of linear actuators, hermetically sealed pumps and valves and large-ratio speed-reduction devices. Technique is believed to be the first to utilize a controlled deflection wave for positive transmission of power and information. Numerous applications described. Research Division, United Shoe Machinery Corp.

Circle No. 209 on Subscriber Service Card.

TAPES AND RESINS. Application information and specifications for pressure-sensitive electrical tapes and epoxy resins for electrical insulations are listed in a 32-page guide book and catalog. Contains physical and electrical properties, suggested applications and application procedures, data for choosing correct product, recommended tests for corrosion, guides for choosing electrical tapes, temperature limitation charts, and other data. Minnesota Mining and Manufacturing Company.

Circle No. 210 on Subscriber Service Card.

PNEUMATIC TRANSDUCER. Operation of the pneumatic transducer, an electromechanical device for instantaneously converting 3-15 psi input pressures into ac signals, is explained in a catalog sheet published by Fischer & Porter Co.

Circle No. 211 on Subscriber Service Card.

PRINTED CIRCUITRY. Brochure on printed circuits containing full descriptive data on materials, specifications, design tolerances and application information. Printed Electronics Corp.

Circle No. 212 on Subscriber Service Card.

HIGH-PURITY METALS. Information on ordering and purchasing ultrahigh-purity materials for semiconductors and soft-solder preforms for automatic soldering is contained in a booklet published by Alpha Metals, Inc.

Circle No. 213 on Subscriber Service Card.

FLUID POWER DIRECTORY. The 1958/59 edition of this directory is available at $6.50 in five sections covering fluid power components, trade names, manufacturers' catalogs and sales outlets, fluid power design and local fluid component suppliers. Industrial Publishing Corp.

Circle No. 214 on Subscriber Service Card.

BLIND RIVETS. A 16-page catalog and three bulletins describing applications for a new line of drive-pin blind rivets are now available. The low-weight, high-strength rivets are used to solve blind-side clearance problems in fabrication. The illustrated 2-color catalog presents technical data, typical design applications, dimensions and weights for the full line of stainless-steel rivets produced by the Deutsch Fastener Corp.

Circle No. 215 on Subscriber Service Card.

METALLIC POWER RECTIFIERS. An illustrated 32-page guide to metallic power rectifiers, utilizing germanium, silicon and selenium semiconductors, has been published. The guidebook covers applications for rectifier equipment such as anodizing, battery chargers, electrocleaning, electroplating, ground power supplies and complete semiconductor power conversion systems for the operation of electrolytic cells. Sel-Rex Corporation.

Circle No. 216 on Subscriber Service Card.

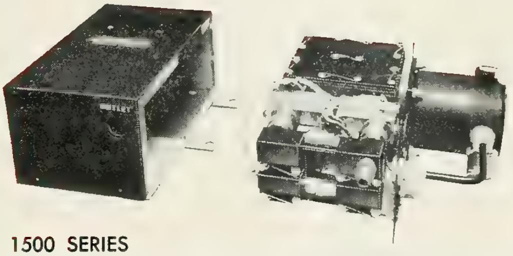
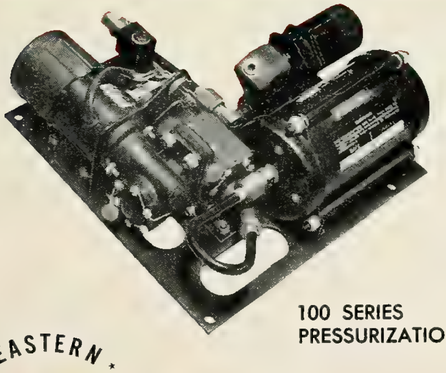
PRESSURIZING AVIONIC SYSTEMS

Eastern pressurization equipment protects vital electronic gear. A continual program of research and development creates customized pressurization units that keep the performance of avionic systems unaffected by altitude and ambient conditions. Custom units that *meet military specifications* help to solve your problems when recommending electronic components.

When you have a challenging problem to prevent pressure, or heat, or moisture, or dust from affecting electronic performance, come to Eastern for complete and creative engineering help.



1500 SERIES
PRESSURIZATION UNIT



100 SERIES
PRESSURIZATION UNIT

EASTERN PRESSURIZATION UNITS

A variety of capacities accommodates a broad range of requirements and meets appropriate government standards. Typical units operate from zero to over 70,000 feet at temperatures from —65°F to +160°F. Delivery: 0-3600 cu. in./min. free delivery, Discharge Pressure: 0-60 p.s.i. Standard sub-assemblies and components normally are used to create a custom-made design to fit your exact needs. Units may consist of an air pump and motor assembly, pressure switch, check valve, tank valve, terminal connectors, and dehydrator.

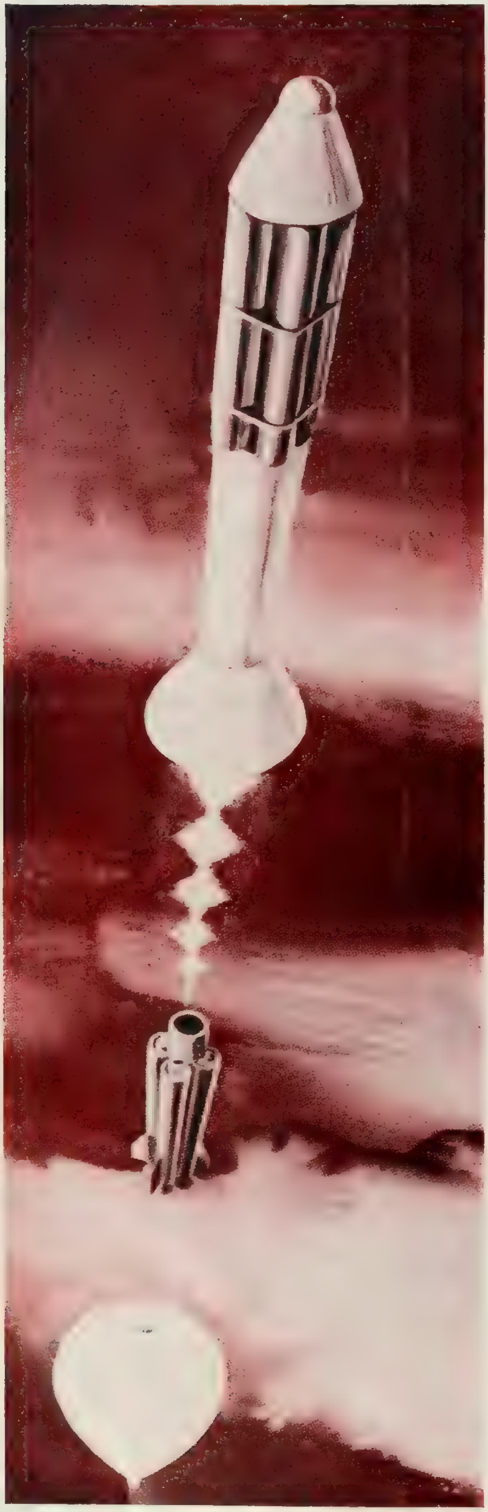
FIRST GIANT STEP INTO SPACE



Grand Central Rocket Sets Altitude Record in "Operation Far Side"

The Air Force has confirmed that it recently fired a rocket to a height of more than 4,000 miles above the earth's surface. The 1900-lb. research vehicle with its $3\frac{1}{2}$-lb. instrument package was launched from a balloon-supported platform, 20 miles above Eniwetok atoll in the Pacific.

Ten solid propellant rocket engines powered the multi-stage missile on its mission into outer space at a velocity in excess of 17,000 mph. The third stage consisted of a cluster of four Grand Central ARROW II rocket engines, and the fourth and final stage of a single ARROW II.

Because of demonstrated performance and reliability, Grand Central Rocket Co.'s ARROWS were selected by Aeronutronic Systems, Inc., a subsidiary of the Ford Motor Co., to play this prominent role in the Far Side Vehicle.

Grand Central
Rocket Co.
REDLANDS, CALIFORNIA

Grand Central Rocket Co., with its selected scientists, engineers, and administrators, is constantly engaged in the research, development, and production of solid propellants, solid propellant rocket engines, and component parts to further serve industrial, scientific, and military agencies. Grand Central would like to work with you on your propulsion problems.

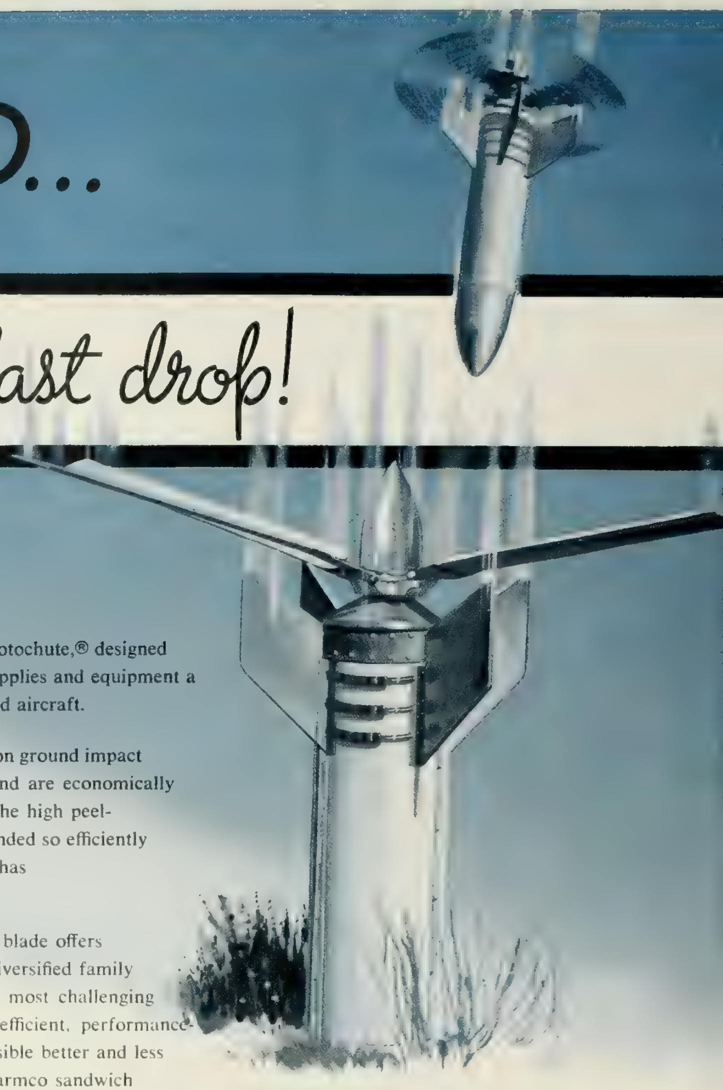
GLUED...

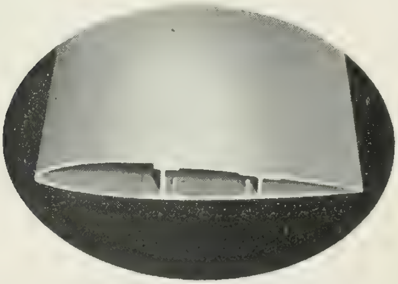
...to the last drop!



The U.S. Marine Corps' efficient new Rotochute,® designed and built by Kaman Aircraft Corp., gives supplies and equipment a quick, safe drop from a low-flying, high-speed aircraft.

The rotating blades are designed to fail on ground impact to preserve the container and rotor head, and are economically fabricated of aluminum sheet bonded with the high peel-resistant Narmtape® 102 system. In fact, bonded so efficiently that the joint remains intact after the blade has been destroyed by impact!

This inexpensive, expendable Rotochute blade offers a further proof of the ability of Narmco's diversified family of adhesives to provide the solution to the most challenging aircraft and missile design problems . . . efficient, performance-proven, economical solutions that make possible better and less expensive structures. Proof, also, of how Narmco sandwich and metal-to-metal adhesives are *doing jobs every day that metals alone can't do!*



Write today for specific performance and fabrication data on NARMCO structural adhesives. Narmco technical field representatives throughout the United States, Canada and Europe can assist in solving your structural design problems quickly, efficiently, economically.

DESTINATION:
KINGDOM COME

PILOTLESS, poised to rocket into the arena of the skies—America's guided missiles stand ready to seek out and blow any marauder to "kingdom come."

A pioneer in this nation's missile program, Goodyear Aircraft Corporation has made many substantial contributions to these vital defense weapons.

It has developed a guidance system which gives these robots a pathfinding instinct of uncanny accuracy.

It builds booster cases which give "thrust" for the blast-off.

It fabricates Bondolite, the bonded structural sandwich material which can give strength without weight-penalty to their airframes.

It produces GEDA, the Goodyear Electronic Differential Analyzer—an analog computer of advanced design which makes it possible to pre-test the performance of these missiles without launching them, to predict their behavior and path.

In missiles, metal-working, plastics, electronics and many other fields—Goodyear Aircraft Corporation has demonstrated itself to be a reliable member of America's air team, a vital partner to this nation's aeronautic industry.

GOODYEAR AIRCRAFT

"Here's the news we promised you"

FANSTEEL

TANTALUM SHEET

IS NOW AVAILABLE FROM STOCK

For the first time since the beginning of its commercial production, Fansteel Tantalum Sheet is now available from "on hand" warehouse stocks.

With our new Muskogee, Oklahoma plant now in production, and our expanded processing and fabricating facilities at North Chicago in full operation, we can make delivery of unannealed sheet from stock—annealed sheet within two weeks.

If you are now using tantalum or are planning its use in your product, you can count on Fansteel to deliver tantalum in any form or shape—on time to meet your production schedules.

And you can count on Fansteel quality. Our completely integrated production, with strict quality control in all of the steps from the processing of the ore to the finished metal, guarantees you the finest quality tantalum.

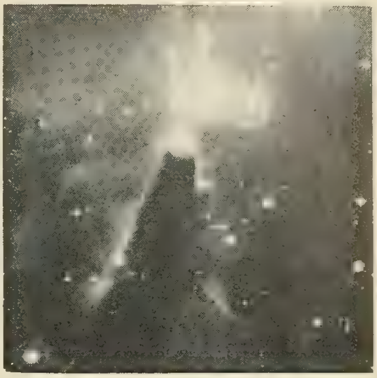
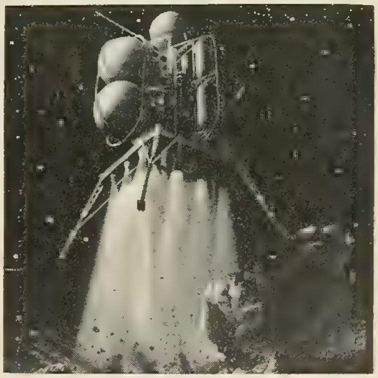
cover picture:



Many light years' travel away, in the far reaches of our galaxy, is the constellation Monoceros. This cluster of stars and cosmic dust, east of Orion, may some day be the goal of space explorers. Even then, many years will be required to make the round trip. The nebulosity in Monoceros was photographed in infrared by the 200 inch telescope at the Palomar observatories.



Japanese science artist Itokawa visualizes an unmanned rocket vehicle landing on the moon. Electronic and guidance devices will be needed to insure that such vehicles go where they are aimed, unfold landing legs and activate reverse-thrust rockets as required. Perhaps such projects are more a challenge to the electronics and guidance industry than to the propulsion experts.

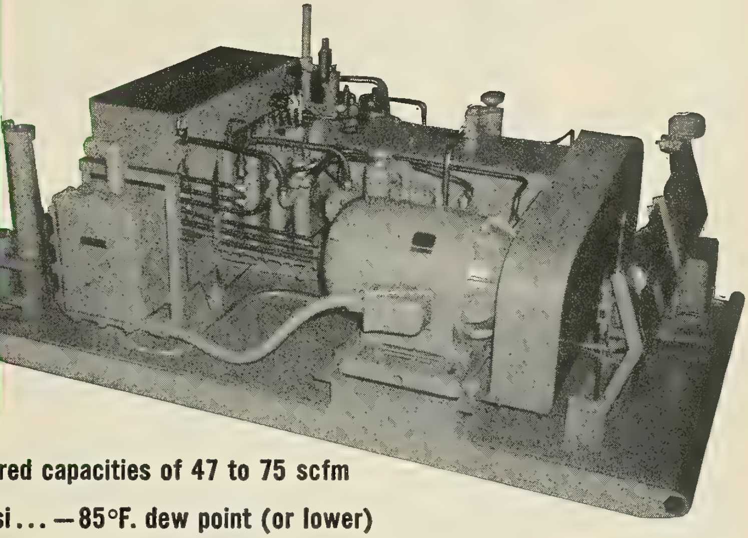
HELIUM compression problems?

. . . not when you specify a

CARDOX

central compression system



Guaranteed delivered capacities of 47 to 75 scfm at 3500 to 12,000 psi . . . —85°F. dew point (or lower) . . . not over 4 parts per million oil content

Completely pre-engineered compression systems— Individualized to meet your specific job or project needs, without further engineering at location.

Field-proved, trouble-free compressors . . . 4 or 8-cylinder, 4 or 6-stage.

Positive moisture and oil removal . . . mechanical separator with back-pressure valve—purifier cartridges for final moisture and oil removal.

Integral or remote storage . . . for high flow rates – no waiting for build-up.

Full range or mobile, semi-portable or extended fixed systems for HELIUM, NITROGEN, AIR OR *ALL THREE.*

WRITE FOR NEW TECHNICAL BULLETIN AND FULL INFORMATION. *COMPLETE PROPOSALS PROMPTLY FURNISHED* upon receipt of your application data.

CARDOX CENTRAL COMPRESSION SYSTEMS

CARDOX CORPORATION

HIGH PRESSURE PNEUMATICS DIVISION
307 N. Michigan Avenue • Chicago 1, Illinois

DISTRICT OFFICES AND WAREHOUSES THROUGHOUT THE NATION
Western States Distributor: General Air Equipment
824 Hollywood Way, Burbank, Calif.

Backed by 20 Years of Research, Continuous Engineering and Production Manufacture!

CARDOX Central Compression Systems were perfected through the engineering and building of hundreds of compressors and their associated equipment, operating in the 12,000 psi range of high pressure pneumatics. In their most numerous use, these compressors supply the high pressure air used in mines instead of explosives to produce nearly 20% of all bituminous coal output of the U. S.

CARDOX Central Compression Systems are now supporting missile testing and are also used by manufacturers of missiles in their component testing.

CARDOX' experience in such varied high pressure pneumatic activities is unequalled. It is one reason why with CARDOX Central Compression Systems you have not just *low* maintenance, but virtually *no* maintenance needs at all.

We're Falling Behind Again

The attitude of the Administration toward our missiles and rockets programs can be summed up in two words: impractical and inadequate. As for its attitude toward nuclear rocket research, there is only one word: calamitous.

We are falling behind again—in the face of the harsh news from Russia (see page 37) that its first atomic-powered airplane will be flying soon.

One thing is crystal clear: the fact that we possess both the knowhow and the ability to build a nuclear rocket. Scores of nuclear scientists at the recent ARS meeting in Dallas and at the Nuclear Congress in Chicago agreed that we have been extremely slow and much too hesitant in getting any atomic rocket program under way. They assert that this country could have had a working test model of an atomic rocket powerplant today if we had activated some of the ideas and proposals submitted by our nuclear experimenters some five years ago.

It was generally known at the time that the Russians were progressing rapidly in the nuclear rocket field. But our national leaders exhibited an inexcusably disinterested, outright perilous attitude. Not only was it considered ridiculous to talk about nuclear-powered aircraft (and practically all work on such projects was ordered to a halt), but anyone who discussed openly the feasibility of nuclear rocket propulsion was labeled a dreamer—probably because the only imminent application of such systems was for space flight!

Rep. Carl T. Durham (Democrat, North Carolina) and Chairman of the Joint Congressional Committee for Atomic Energy, struck a solemn note at the recent Nuclear Congress in Chicago when he declared that civilian control of the military atomic energy and outer space programs is being endangered by crippling efforts of the military to enhance its role in both projects.

Two years ago Russian rocket researcher and physicist G. Nesterenko outlined in much detail drawings of an atomic rocket engine. More recent technical papers and numerous official statements by other reputable Soviet scientists clearly indicate that a substantial amount of work is being conducted in this field in the Soviet Union. In the meantime we continue to discard the importance of such work and are doing little or nothing about it.

It's almost unbelievable that it took a *Sputnik* to speed up America's satellite program. Even more fantastic is the thought that we must wait for the first flight of the Russian atomic airplane to understand the necessity for the stepping-up of a nuclear aircraft and rocket powerplant program in this country.

The administration didn't have any valuable explanations when the *Sputniks* were launched; there were numerous speeches and lots of talk about America moving ahead. There was agreement that we needed a scientific advisor at cabinet level, that we must establish a space flight agency, reorganize our educational system and pay more attention to our scientists. The situation, it was agreed, was alarming. Yet little or nothing tangible has been done to correct it.

Probably the American public accepted the sorry news about Russia's rocket advances as a bitter fact that you just couldn't blame anyone for—*maybe*. But we doubt that anyone will accept any more Russian technological victories such as a nuclear airplane, an atomic-powered space rocket or a rocket to the moon. We already have fallen far behind. Another technical defeat may leave us behind forever.

a must for your files...

free data books from Allegheny

SPECIAL STEELS FOR INDUSTRY . . . 16 pages, jam-packed with technical information on principal Allegheny Ludlum products: stainless, tool and electrical steels and Carmet carbide materials. Includes: a stainless steel Finder chart giving analyses, physical data, properties, etc.; data on stainless fabrication; stainless corrosion resistance to various media; charts on electrical materials and Carmet carbide materials; properties and treatment for principal A-L tool steels.

STAINLESS STEEL IN PRODUCT DESIGN . . . 40 pages of useful engineering and fabricating data including practical examples showing where, when, how stainless steel improves design, adds benefits, helps sales. Information includes: standard sizes and shapes; designing for lower costs in forming, joining, finishing, etc. with many pictures of actual products made and designed in stainless steel.

PUBLICATION LIST . . . 8-page folder that lists and describes all the current publications offered by Allegheny Ludlum: 9 general publications, 14 on stainless, 10 on stainless applications in specific industries, 16 technical data sheets on stainless, 40 on tool steels, 20 on Carmet carbide materials, 5 on forgings and castings, 12 on electrical steels. There is a handy order form to use in getting the data you need.

As *the* major producer of special alloy steels for industry, Allegheny Ludlum naturally offers much more than steel. Ten strategically located plants provide prompt mill deliveries and stock shipments are made from warehouses in all industrial centers. Staff specialists from the mills working with the sales engineers from the sales office provide assistance when requested. Whenever you have a problem involving stainless, high-temperature, electrical, magnetic or tool steels or sintered carbides, let us help. *Allegheny Ludlum Steel Corporation, Oliver Building, Pittsburgh 22, Pennsylvania.*

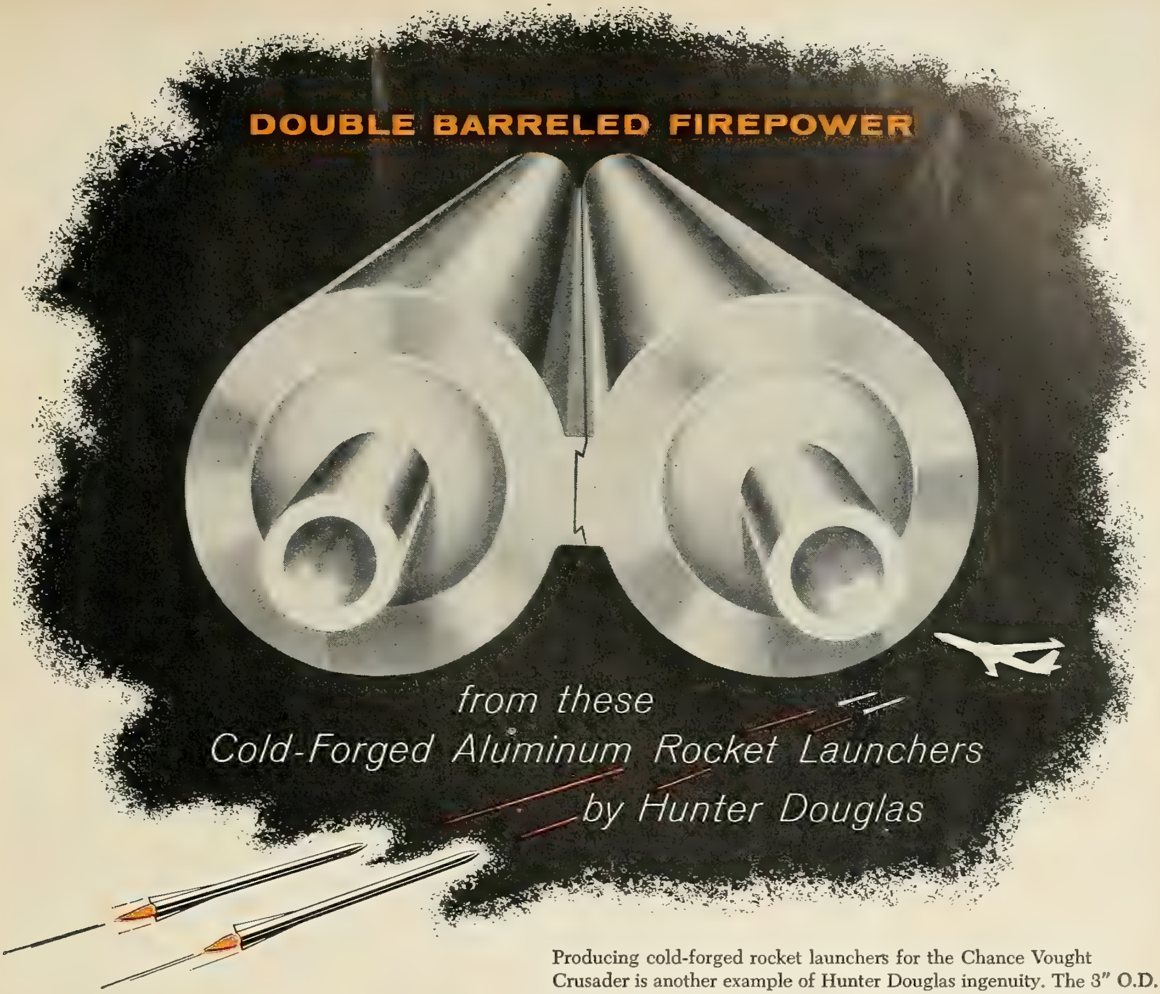
DOUBLE BARRELED FIREPOWER



from these Cold-Forged Aluminum Rocket Launchers by Hunter Douglas

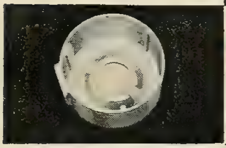
Producing cold-forged rocket launchers for the Chance Vought Crusader is another example of Hunter Douglas ingenuity. The 3″ O.D. tube, approximately 100 inches long with an .046″ wall, with one end closed, required a fantastic arrangement of internal and external longitudinal ribs, almost impossible to fabricate by conventional methods.

Even cold forging with its ability to integrally form complex part geometry, was put to rigorous tests. For example, cross sections of the tubes were non-symmetrical, generally a serious taboo in cold forging techniques. Further, the non-symmetrical design aggravated longitudinal bow, yet tubes had to be straight within .120″ overall. Finally, retention of a minimum wall adjacent to the heavy section presented the problem of uniform metal flow. The heat treated tubes must withstand 1400 psi hydrostatic pressure without deformation.

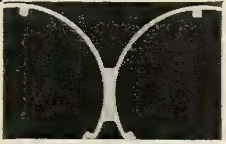
By combining the varied talents of an experienced engineering staff, good tooling design and sound production techniques, the *cold forged rocket launcher is a fact today*... assembled from two cold forged tubes mechanically joined by a dovetail. Simpler and lighter in design, the cold forged launchers are built to closer tolerances, with greater strength *at less cost!*

If your components can be cold forged, Hunter Douglas can do it! For recommendations, submit your prints or samples.

Section is removed to show internal detail of closed end.



An end sawed from the full length tube illustrates internal and external ribs as well as end detail.



Joining the twin barrels was solved by a dovetailing operation. The wide external rib seen in Fig. 2 provides dovetail area.

Overall tube length is indicated here. Entire unit is one piece. Dovetailing is the only assembly operation required.

Washington Trends

by Elizabeth Oswald

Navy needs a breakthrough improving air search radar capability substantially if missile cruisers are to do their job. What's wanted is a lightweight antenna which can be handled by mechanical means. Otherwise, use of missiles for cruisers and destroyers will be limited. Navy has an industry committee working with BUShips specialists trying to solve the problem.

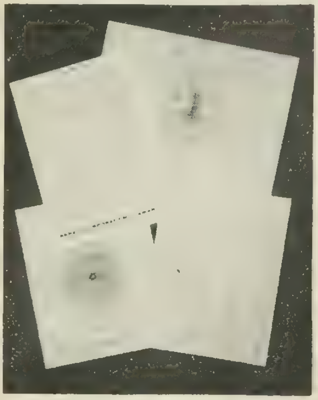
One approach to the solid-propellent breakthrough is to add aluminum powder to composite fuels, according to RAdm. F. S. Withington, long-time chief of the Bureau of Ordnance. More than 15 percent powder is being added by at least one company. Heat generated with the addition of the powder makes the fuel almost too hot to handle with current materials. However, use of the powder described as finer than cigarette ash provides a substantial boost in energy.

First two bases to be equipped for handling the Air Force's *Goose,* decoy missile built by Fairchild, have been designated. Some $10 million will be spent on developing Ethan Allen AFB in Vermont and Duluth Municipal Airport in Minnesota.

Battle between metal and plastics manufacturers may be brewing as a result of the apparent decision of Army Ordnance to stay with metal boosters for *Nike-Hercules* despite the reportedly successful firing of more than 150 fiber glass boosters for *Nike-Ajax* which are frangible, breaking up like clay pigeons after burnout. Argument is that the glass fiber boosters are cheaper, use no critical material and provide no danger of injury to people and property when the boosters drop off. Growing feeling is that interservice rivalry at development and research levels is being overplayed. Real competition exists in cloudy areas of roles and missions, with each service fighting to preserve operating functions. Record indicates cooperation between services on many research projects, the outstanding example being the work of the Navy and Air Force with the National Advisory Committee for Aeronautics.

Chances are that Dr. James Killian, Jr. will recommend establishment of a new space agency, under civilian control. Proposal won't necessarily affect the role of Advanced Research Project Agency as a coordinating agency within Defense Department but should stop any plan to make ARPA a kind of super new governmental service.

Indications are that any new agency would lean heavily on existing facilities and personnel of the National Advisory Committee for Aeronautics and its well-established techniques for working with the Army, Navy and Air Force. Future of ARPA will be raised again when Congress starts marking up the Defense Appropriation Bill for fiscal 1959.



An Engineer Speaks Out...

Here's the EASY Way to Work Up A Nyquist, A Bode and A CPC

If you're working on servosystem test or design, you'll want to have these FREE chart forms . . . a wonderful time-saver! The coordinates are already lettered and the legend imprinted. They are transparent "masters". Almost any duplicator assures you of an immediate supply of charts at any time.

When you get the frequency, phase angle, and amplitude loci plotted on these worksheets, you've got a "standardized" permanent record of the system you are checking.

The Complex Plane Conversion Chart, Worksheet #104, should be particularly helpful. On it are plotted the loci of constant closed-loop gain (in units of voltage ratio) on the horizontally axial circles, and the constant-loop phase (in degrees) on the vertically axial circles. These loci are plotted over Cartesian coordinates, the ordinate of which represents the unreal, and the abscissa the real, component of the gain vector.

Suggestions for an uniform procedure in working up the different curves are included.

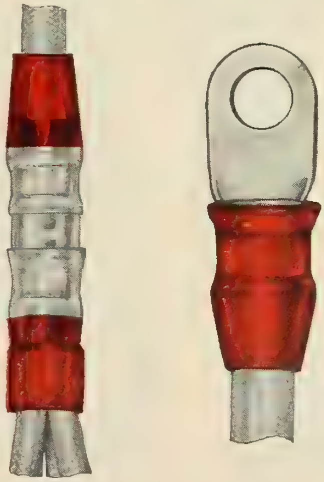
the entirely NEW insulated A-MP terminal line for large wire sizes

FEATURES:

- High Performance Nylon Insulation to provide continued satisfactory service life at elevated temperatures, plus resistance to ester-based oils.
- Helical tongue design to secure maximum structural utility at minimum weight penalty.
- Cast insulation has formed entry ramp to provide easy wire insertion and snug fit over standard AN wires.
- Color-coding to assure proper terminal selection for applicable wire sizes.
- Step-Lok Crimp to guarantee continued proper position of insulation with respect to terminal.
- Connector designs are available in single to single, single to multiple and multiple to multiple wire accommodations.

The A-MP Ampli-NYL Terminal is installed with the proven Confined "C" Crimp for maximum electrical and mechanical performance. Confining the spread of the terminal during the crimping process achieves more intimate contact and a homogeneous union of conductor and terminal.



Additional information is available upon request.

BIG PUSH... PACKED IN LUKENS "T-1" STEEL!

TRADE-MARK

■ Now from Lukens—alloy steel plates to wrap one of the highest thrust solid propellant rocket engines ever fired, the "Producer," developed and tested by Phillips Petroleum Company.

In Lukens "T-1" steel, engineers and designers found the ideal material to confine the "Producer's" special propellants: an alloy combining light weight, toughness, and economical fabrication. It's another example of how Lukens, drawing from its wide range of special duty steels, provides materials just right for the job—essential in modern defense equipment.

Our illustrated booklets LUKENS "T-1" STEEL and CLAD STEEL EQUIPMENT furnish more detailed information on the Lukens family of products. For your copies, or assistance on any specific problem, write Manager, Marketing Service, Room 111, Lukens Steel Company, Coatesville, Pennsylvania.

Now! Cool through the thermal barrier with FLAMEMASTIC!

The high-heat insulating *material proved* in *actual production* for *4 years*

Now, you can provide positive protection and high-heat insulation for metal surfaces with FLAMEMASTIC. For four full years, FLAMEMASTIC has been used exclusively on one of the major production missiles. And it has been applied extensively in other experimental firings of rockets and missiles and on allied test and launching equipment.

FLAMEMASTIC protects against high-velocity combustion heats, ranging from 3000°F. upward. This insulation provides positive protection for vital electronic equipment.

FLAMEMASTIC is readily applied by conventional application methods.

HIGH ALTITUDE PHOTO ABOVE EGLIN AIR FORCE BASE

FIREBEE: "ENEMY" JET OVER AMERICA

The most realistic "enemy" in the skies over America today is the Ryan Firebee. This jet-fast, elusive target drone is being used to sharpen the sights of the men who man the nation's air defense system and to evaluate the missiles upon which they rely.

The Firebee flies at the high speeds and altitudes required to test the performance of the newest, most deadly air-to-air and ground-to-air missiles. It possesses the maneuverability and extended duration needed to realistically simulate "enemy" intercept problems.

Developed by Ryan for the Air Force (Q-2A), Navy (KDA-1) and Army (XM21), the Firebee is in volume production and operational use. It is being fitted with special radar and infra-red reflective devices for simulating varied target characteristics and providing broader missile-target compatability. The Firebee can be equipped with wing pods to carry added fuel... a warhead... photo or television reconnaissance gear.

The Firebee is an example of Ryan's skill in blending advanced aerodynamic, jet propulsion and electronics knowledge to produce a highly successful solution to a complex aviation problem... meet a vital military need. Other examples are the Air Force-Ryan X-13 Vertijet and Navy-Ryan AN/APN-67 automatic navigator for global jet flight.

New Version Coming Up

To the Editor:

I have noticed with interest that you have available a "Guided Missile Encyclopedia." As I am a member of the department of the U.S. Army Air Defense School which is charged with the writing of Department of the Army Field Manuals for surface-to-air missiles, it occurs to me that such an encyclopedia would be of considerable interest to us.

It would be appreciated if you would quote us the price.

In passing, I might say that your magazine, m/r, is read enthusiastically by all of my associates in the Training Literature Division.

Capt. C. N. Johns
United States Army
Air Defense School
Fort Bliss, Tex.

Reprints of the 1957 encyclopedia are available at $1.00 each. The July issue of m/r will carry an even more comprehensive missile encyclopedia.—Ed.

Enemy Dismissed?

To the Editor:

I think you will agree that the term "anti-missile missile" is a cumbersome description for an agile bird. What will we call the "anti-anti-missile missile" when it arrives?

The time has come when we should name the anti-missile missile a "dismissile" and the weapon with which we destroy it ought to be termed a "counter dismissile."

Robert Bicknell
Washington, D.C.

No Slight Intended

To the Editor:

We have, of course, more than a passing interest in the missile electronics procurement article in your February issue, authored by Selig Altschul.

But we must be frank and say that we could not understand why our division was not included in the chart on page 76, identifying companies in various phases of electronic controls or missile activities. As you probably know, Autonetics does a gross annual business approximating $100 million in the electronics and electromechanical fields.

We would therefore expect to be included in the published list on the basis of our business volume and size. Anything that you might be able to do to see that we are included in future lists would be sincerely appreciated.

Kerme Anderson
Autonetics Division,
North American Aviation, Inc.
Downey, Calif.

Chart was intended to be representative, rather than complete. Because of this, many companies with intense activity in the missile-electronic field were omitted.—Ed.

Silicone Limits

To the Editor:

We were very pleased to see the excellent coverage in the March issue of the many ways in which silicones are being utilized to produce better, more reliable rockets and missiles. However an unfortunate contradiction about the operating limits of silicone lubricating fluids appears in the lead article.

The staff report that General Electric's Versilube (R) silicone fluids are functional in the 575-700F is of course correct. In fact, hydraulic equipment designed for use with these fluids at double the 350F level mentioned by Mr. Rous is commercially available.

It is unfortunate that Mr. Baker, in his article "Silicone Applications in the Missile Industry," did not cover all of the major silicone producers in obtaining material for his survey on silicone applications in the missile field. Thus he did not mention significant General Electric contributions such as the Versilube fluids; SE-555, a silicone rubber with the physical strength formerly associated only with organic materials; the RTV (Room Temperature Vulcanizing) compounds for a variety of applications where silicone rubber could not previously be used . . .

W. E. Harris
General Electric Co.
Waterford, N.Y.

Mr. Rous' treatment of hydraulic fluids in his article "Materials Build a New Technology" was not intended as a roundup analysis of the hydrogenated aromatic mineral oil or methyl phenol silicone market. His brief mention of the current 350°F limit for silicone base fluids was a reference to the broadly accepted status of the market. We appreciate your efforts in re-emphasizing the current availability of your silicone lubricant that operates above the 350°F "limit."

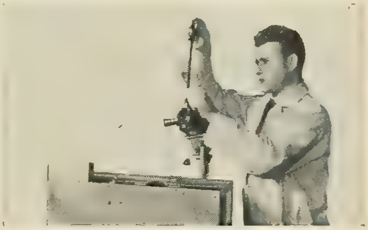
In the article "Silicone Applications in the Missile Industry" no effort was made to completely cover this vast industry. It was presented as a selective representation of one company's products and their applications.—Ed.

New 16mm. processor

DEVELOPS FILM AT SIX FEET A MINUTE

Speedy, commercial quality processing of 16 mm. film, without the use of a darkroom, is now possible with Fairchild's "Mini-Rapid 16" Processor. Here's how you can process a 100-foot roll of film, "from shooting to screening," in just 20 minutes.

1. Minutes after shooting, a 100-foot film spool is dropped into the feeding compartment. To develop, the operator simply feeds the first few inches into a slot in the compartment.



2. Less than two minutes later, the first few feet emerge, dry and ready for inspection. The operator can adjust to compensate for exposure or chemical temperature variances simply by turning the drive speed control knob.

3. After another fifteen minutes, the 100-foot roll is completely developed—another three minutes to load projector and it's ready for screening!

If you require commercial quality negative processing of 16 mm. film for immediate viewing—service never before possible—investigate Fairchild's new "Mini-Rapid 16" Processor. It's already in demand by industry and television.

For a demonstration in your own plant or office, write Fairchild Camera and Instrument Corporation, Industrial Camera Division, Dept. 9M, 5 Aerial Way, Syosset, Long Island, New York. West Coast Office: 6111 East Washington Boulevard, Los Angeles, California.

Missile Business

by Seabrook Hull

No-profit contracts may be one result of a basic philosophical change occuring in top Pentagon circles. Conversely, other defense contracts may allow much greater profits than can now get through the Renegotiation Board. Nothing formal has yet been done in these directions. But frustration over the lack of incentive in the current methods of doing defense business, plus the lack of any means of enforcing performance on contracts is leading to an almost universal determination "to do something about it."

Of considerable cost, both in dollars and in terms of defense in being, is the fact that defense contractors have no real incentive to perform according to the original terms of the contract agreement—delivery on time at the price agreed to of hardware than can reliably do the job. Neither is there any means of policing companies that knowingly bid low on a contract on which they cannot possible perform without repetitive renegotiation of the price and terms of the contract.

Experienced Pentagon officials, at the Department of Defense and Service Secretary level, are increasingly convinced that the present system of armed forces procurement needs modifying so as to reward those who perform well and penalize those who don't. One plan now receiving wide consideration would allow greater-than-now profits to companies who performed in an outstanding manner by delivering on time, at agreed to or better-than-agreed-to prices, by making product improvements, etc. At the same time the proposed system would penalize those companies which failed to perform according to agreement by reducing or eliminating their allowed profits.

Such a system would have a number of benefits. It would encourage many efficient companies who now have no interest in defense business, because of low profit rates allowed, to compete for business. It would provide more of an incentive than conscience (as now) for performing as contracted. Finally, it would benefit the American public by getting more defense in less time for less money.

Air Force has officially blessed the group method of systems bidding. In a letter from AMC Deputy Director of Procurement and Production Major General Wm. T. Thurmond to the National Security Industrial Association, the Air Force described the "group" as a possible accepted form of contracting. The letter stated that the weapons system concept was susceptible to management proposals from systems managers and subcontractors for future design and development. It said that the subcontractors in the group should include all the systems elements, such as airframe supplier, electronics, guidance, propulsion, groundhandling (etc.) suppliers. In mind are such groups as those by Hoffman Electronics, and Stavid Engineering.

This letter may have more significance than meets the eye. Some are interpreting it as official recognition of the fact that the military cannot always just go to the traditional airframe makers for systems contracting; that syndicates may turn out to be a good alternate source—so long as they are properly organized, giving due attention to the antitrust laws, small business, responsibility for performance and knowledge of just how to file and negotiate as a group. In any case, it's a development well worth watching.

three to make
ready for outer space…
BORON
LITHIUM
AMMONIUM
PERCHLORATE

TRONA* is basic in the chemistry of high energy fuels and solid propellant oxidants.

Wherever men make ready for outer space…from barren arctic IGY laboratories to tropical ballistic missile blast-offs…Trona chemicals are putting the punch into high energy fuels and other propulsion systems. As the only basic producer of these three important raw materials used in high energy fuels and as solid propellant oxidizers—BORON, LITHIUM and AMMONIUM PERCHLORATE—American Potash & Chemical Corporation has a vital stake in the space age. Recipient of the 14th Annual Chemical Engineering Achievement Award for pioneering work in the atomic age metals, Trona continues in the forefront of basic research and technical development of these vital chemicals and their compounds for high energy and missile applications.

contract report

Trends

Seven rules for getting Air Force contracts were laid out before the Texas Manufacturer's Association at a recent dinner in Houston by Assistant Air Force Secretary for Materiel Dudley C. Sharp. Here they are: (1) Get to know Air Force projects—their mission, specifications and time requirements; (2) be cost-conscious and keep overhead charges to a minimum; (3) study the engineering side of the project and figure out how to do it with a minimum of effort and overtime; (4) be prepared to fund the initial stages of the program; (5) have sufficient production talent and the most advanced tools; (6) know your production limits and bid accordingly; (7) know Air Force contracting procedures.

Secretary Sharp said: "Any contractor who consciously applies these actions can obtain defense contracts which would be profitable to himself as well as to national security." Sharp added that 8.2% of Fiscal Year 1957 prime contracts went to the smaller firms while the 21.5% of prime contracts going to large firms was eventually subcontracted to smaller firms—for a total of $1.5 billion.

In fact, a much greater share of both prime and subcontracts are of the small business variety. It's true that they may go to big companies, but they are small in dollar volume and they go to divisions of large companies which are, in effect, small firms. In other words, the volume of business available to small business is much greater than that indicated by official statistics.

New prime and subcontract leads include: Official O.K. given by Defense Department missile czar William A. Holaday to Air Force for three more IRBM/ICBM projects, including: a solid-propellant ICBM; *Polaris* as a land-based IRBM; development and production of a new oxidizer for *Titan*.

Another possible contract lead: Army is eyeing a hopped up version of the Navy's *Talos* for possible development as an anti-missile missile. Navy also is interested in further development of *Talos* as a countermeasure for ballistic missiles fired from submarines. Problems Army and/or Navy would like to see solved include: guidance for anti-missile missile role; better propellants for longer range and faster interception. Still another lead to watch: AF may buy *Regulus* II missile for surface-to-surface work.

Two bills on Capitol Hill will affect defense contracting—if they're enacted. S.3223 would extend the Defense Production Act for another two years. This is the law that gives the Office of Defense Mobilization its authority. Status: expected to be extended without question, including government guaranteed loan provision. H. R. 10830 is concerned with helping in replacement of out-of-date machine tools. Would be concerned with maintenance of modern defense production equipment in both privately owned defense contract plants and government arsenals.

Another bill, well on the way to enactment, would return government accounting to an accrued expenditure basis. It has disadvantages, but would prevent recurrence of last fall's squeeze between cash on hand and debt ceiling which resulted in untimely defense spending cutback.

Navy's in the market for developers of newer and better heat-resistant materials, particularly for atomic propulsion systems . . . Rep. F. Edward Hebert's special House Armed Services Subcommittee is starting a new investigation, particularly of Pentagon logistics and procurement policies . . . U.S. has earmarked $666 million for missiles for other nations.

Awards

Nike-Hercules: Western Electric Co., $129,592,706 for *Nike-Hercules* missile and ground equipment contracts—from Army. **Douglas Aircraft Co.,** $43.5-million for *Nike-Hercules* production and fabrication. Other contractors include **Goodyear Aircraft Co.** and **Borg-Warner,** booster hardware; **Thiokol Chemical Corp.,** sustainer motors; **Hercules Powder Co.,** booster motors; **Consolidated Western Steel Co.,** launchers.

R&D on Missiles at Jet Propulsion Laboratory: California Institute of Technology, $22.7-million from Army.

Q-2 Firebee: Ryan Aeronautical Co., $1,387,293 for production, from AMC.

Thor and Atlas: Republic Aviation Corp., $1.5-million for *Thor* and *Atlas* nose cone components, from **General Electric MOSD.**

Summary of $118 million in Army missile contracts for December 1957, shows: to **Western Electric Co.** for *Nike* family contracts of $31,058,200; $5,808,750; $3,182,903; $1,360,800; $3,718,366, $13,175,420; and $1,175,760. To **Raytheon Manufacturing Corp.** for *Hawk* contracts of $2,072,726; $8,049,500; and $8,758,697. To **Chrysler Corp.** for *Jupiter* $10,940,123; $2,356,204; and $8,729,255. To **Sperry Rand Corp.** for *Jupiter*, $1,081,377. To **Ford Instrument Co.** for *Jupiter*, $1.1-million. Plus other contracts: **Motorola,** $2,072,726; **RCA,** $4,777,000; **Douglas Aircraft,** $2,472,424; **Gilfillian,** $2,877,000; and **Martin,** $5,829,000.

Other Contracts Include:

By New York Ordnance District: Ford Instrument Co., $404,619 for designing and developing inertial devices. **Southwest Research Institute,** $32,000 for research on advance medical problems encountered in flight through the upper atmosphere space.

By Philadelphia Ordnance District: Western Electric Co., Inc., $192,993 for *Nike* spare parts & components.

By Rochester Ordnance District: A division of Pfaudler Permutit, Inc., $123,554 for tank for missile.

By Los Angeles Ordnance District: North American Aviation, Inc., $963,000 for rocket engines. **Northrop Aircraft, Inc.,** $69,000 for maintenance evaluation of DATICO equipment. **Motorola Inc., Phoenix Research Laboratories,** $150,000 for development of Airborne instrumentation. **Douglas Aircraft Co., Inc.,** $4,757,939 for launching area items. **Associated Aero Science Laboratories,** $112,000 for civilian technical assistance. **Douglas Aircraft Co. Inc.,** $131,092 for repair parts for *Nike* system. **Gilfillan Bros. Inc.,** $29,868 for repair parts for *Corporal* missile system. **Gilfillan Bros. Inc.,** $1,078,266 for engineering services related to *Corporal* missile system. **Gilfillan Bros. Inc.,** $73,828 for replenishment spare parts for *Corporal*.

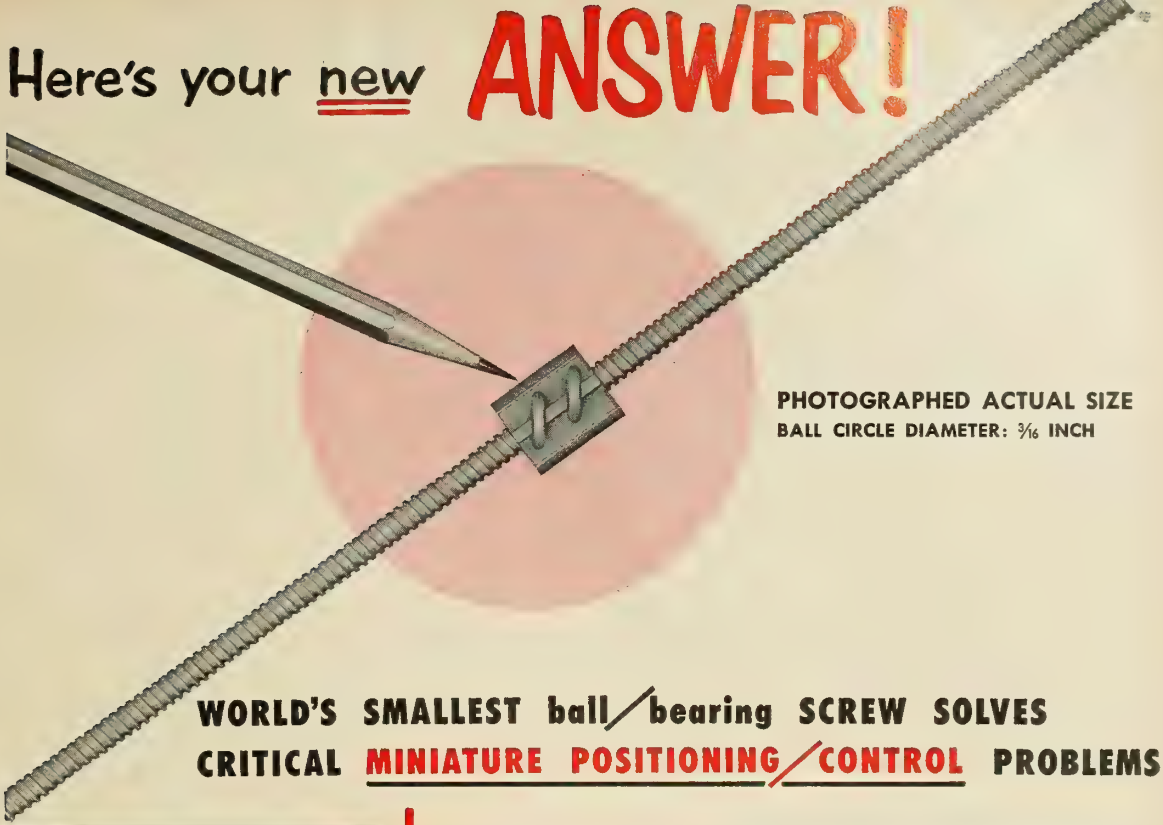
Cleveland Ordnance District: North Electric Co., $131,000 and $179,382 for communications system for *Jupiter*. **Goodyear Aircraft Corp.,** $300,000 for cost contract for acquisition of additional manufacturing facilities. **Ohio State University Research Foundation,** $39,000 for research on the study of amine perchlorates as ingredients for fastburning propellants.

By AF ARDC: Armour Research Foundation of Illinois Institute of Technology, $34,870 for research on the physiological effects of ozone.

By AFMDC: University of Chicago, $53,233 for installation of an acceleration device on short track facility. **Winzen Research Inc.,** $26,000 for cost overrun. **North American Aviation Inc., Rocketdyne Div.,** $225,000 for liquid-propellant rocket sled system. **Phillips Petroleum Co.,** $135,000 for cost overrun. **Grand Central Rocket Co.,** $279,650 for rocket motors. **Thiokol Chemical Corp.,** $105,480 for rocket motors.

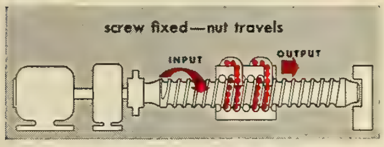
By HQ AMC: Hol-Gar Mfg. Corp., $428,400 for gasoline generator sets. **Marquardt Aircraft Co.,** $198,077 for services for test time at AF Marquardt Jet Laboratory. **General Electric Co.,** $140,981 for 528L targeting sub-

Here's your new ANSWER!

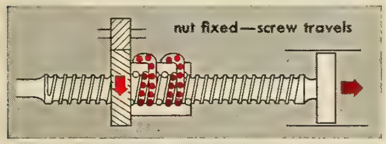


PHOTOGRAPHED ACTUAL SIZE
BALL CIRCLE DIAMETER: 3/16 INCH

WORLD'S SMALLEST ball/bearing SCREW SOLVES CRITICAL MINIATURE POSITIONING/CONTROL PROBLEMS



NUT TRAVELS: When rotary motion is applied to the screw, the b/b nut glides along the axis of the screw on rolling steel balls, converting rotary force and motion to linear force and motion with 4/5 less torque than acme screws.



SCREW TRAVELS: When rotary motion is applied to the b/b nut, the screw glides along its longitudinal axis on rolling steel balls, converting rotary force and motion to linear force and motion with unprecedented efficiency.

An unprecedented achievement in minimum size and weight—maximum efficiency, dependability and service life for ultra-precise controls.

It's another first from Saginaw—and the possibilities it opens up for improved electrical and electronic controls are limited only by your imagination! Radar tuners, missile and rocket guidance and telemetering systems, automatic switchgear, electronic machinery controls are just a few of the applications where this new miniature Saginaw b/b Screw will solve critical positioning/control problems. *It's so compact and light,* you can save substantially on space and weight. *It's so efficient,* (over 90%) you can use much smaller motors and gear boxes. *It's so precise,* you can position components within .0005 inch per inch of travel. *It's so dependable,* you can rely on remarkably long service life even in adverse environments.

You will find our 1958 Engineering Data Book extremely helpful in planning applications, or experienced Saginaw engineers will gladly make specific recommendations without obligation. Just phone, write or mail the handy coupon.

system. **Cambridge Corp.**, $406,226 for MD-1 liquid oxygen tank semitrailer. **Radio Corp. of America, Defense Electronic Products Div.**, $322,565 for auxiliary interconnecting box for missiles.

HQ AFMTC: Wollensak Optical Co., $61,750 for sighting telescopes and accessory equipment. **Cubic Corp.**, $118,450 for increase of funds. **E. C. Morris and Son**, $29,900 for engineering services repair work on test stands and support projects WS-107A and WS-315A.

By HQ AFB: Systems Research Laboratories, $45,395 for modification of fuel test stand.

By Dayton AFD: Tru-Ohm Products Div. of Model Engineering & Mfg. Co. Inc., $26,227 for resistors. **Electronic Div., Westinghouse Electric Corp.**, $116,308 for Westinghouse microwave system map. **John Oster Mfg. Co.**, $25,875 for Oster type motor. **The Hass Instrument Corp.**, $65,520 for estimates for altitude test range. **Aerotec Corp.**, $39,809 for various pressure switches. **General Electric Co.**, $42,435 for transformer. **Sylvania Electric Products Inc.**, $42,120 for tube-electron. **Penta Laboratories, Inc.**, $79,200 for tube-electron. **Receiving & Cathode Ray Tube Operations, Raytheon Mfg. Co.**, $68,200 for tube-electron. **Minneapolis-Honeywell Regulator Co.**, $47,158 for pressure switch. **Van Wagner Co.**, $47,500 for inspections sets. **National Electronics, Inc.**, $58,370 for tube-electron. **General Electric Co.**, $192,183 for tube-electron. **Kuthe Laboratories, Inc.**, $340,972 for tube-electron.

By AFOSR: The Pennsylvania State University, $55,912 for research on crystalline solids. **Polytechnic Institute of Brooklyn**, $50,000 for research on analytical study of high-frequency oscillatory combustion and of scaling up of rockets. **Aerochem Research Laboratories, Inc.**, $54,015 for research on low-temperature plasma jet. **General Atomic Div.**, $57,753 for research on free-radical solids using beam techniques. **Polytechnic Institute of Brooklyn**, $40,000 for research on investigation of plates and shells under elevated temperatures. **University of Miami**, $31,173 for research on nuclear emulsion studies. **The Board of Trustees of the University of Illinois**, $30,300 for study of surface physics. **New York University**, $50,000 for research on elasticity. **General Electric Co.**, $653,317 for studies in heat transfer. **The Institute for Advanced Study**, $40,500 for studies in mathematical analysis.

By Army Signal Supply Agency: Aeronautronic Systems, Inc., $182,355 for research to conduct a study in the guided missile range instrumentation field, modification. **Haller, Raymond and Brown, Inc.**, $46,748 for directory for army electronic and deception equipment. **Trustees of Princeton Univ.**, $66,000 for investigation of high polymers. **Engleman & Co.**, $32,940 for investigation of the vulnerability of electronic equipment. **Stanford Research Institute**, $88,380 for investigation design for ground based antennas. **Tung-Sol Electric, Inc.**, $49,500 for research on utilization of magnesium-oxide electron emission. **Pacific Division, Bendix Aviation Corp.**, $36,135 for investigating the problems in high speed data transmission systems. **Hewlett-Packard Co.**, $60,600 for digital delay generator.

By Redstone Arsenal: Becco Chemical Div., Food Machinery & Chemical Corp., $88,140 for hydrogen peroxide. **Kaiser Aluminum & Chemical Sales, Inc.**, $45,700 for cable reels. **Permanent Filter Corp.**, for liquid oxygen filter. **Allan Aircraft Co.**, $25,196 for AN fasteners. **Collins Engineering Corp.**, $73,132 for AN fittings. **Electronic Associates, Inc.**, $32,025 for electronic equipment. **Thiokol Chemical Corp.**, $194,996 for continuation of research and development of large size rocket engine cases. **Thiokol Chemical Corp.**, $74,944 for engineering evaluation of improved two-level thrust system. **Linde Co.**, $96,360 for liquid oxygen and liquid nitrogen.

By Army, Corps of Engineers: MacGuire-Glaser Co., $168,418 for Army launching area No. 2, Phase II. **R. E. Clarson, Inc.**, $130,388 for telemetry lessee for launch complexes 11, 12, 14, 15, 16, and 19, and CZR camera pads for complex 19, AFMTC, Patrick AFB. **B. B. McCormick & Sons, Inc.**, $251,463 for construction of stone revetment, Canaveral Harbor, AFMTC. **Diversified Builders, Inc.**, $162,786 for construction of Calibration laboratory. **Fairbanks, Morse & Co.**, $119,931 for generator unit and emergency generator set. **Satchwell Electric Construction Co. Inc.**, $402,513 for propellant analysis lab, AFMTC, Patrick AFB. **R. E. Clarson Inc.**, $488,415 for electric power plant, Cape Canaveral Missile Annex, Patrick AFB.

By Army, Engineer Division: Clarkeson Engineering Co. Inc., $53,500 for items for *Nike* sites. **Crandall Engineering Co.**, for items for *Nike* sites. **A. T. Scanzillo Co.**, $93,291 for construction of additional building *Nike* Battery No. 17.

By Army, Engineer District: George A. Rutherford, Inc., $560,451 for engineering analysis. **C. H. Leavell & Co.**, $830,934 for missile assembly bldg., phase II.

By Purchasing and Contracting Office of Army: Harvey Machine Co., Inc., $102,295 for explosive foxhole diggers.

By Ordnance District, Army: Flexonics Corp., $79,287 for supply contract.

By Army, Mobile, Corps of Engineers: The Rust Engineering Co., $43,000 for architect-engineer services in connection with ABMA facilities FY 1958 at Redstone Arsenal. **Daniel Construction Co.**, $441,115 for construction of photographic & video instrumentation laboratory at Redstone Arsenal.

By Navy, Bureau of Ordnance: Aerojet-General Corp., $2,275,470 for solid propellant JATO, rocket.

By Navy, Sixth Naval District; Public Works Officer: Nat G. Harrison Overseas Corp., $362,500 for additional instrumentation for the AFMTC.

By Navy, Bureau of Aeronautics, Purchasing Office Dept.: Stanford Research Institute, $99,812 for investigating the application of steel honeycomb and other sandwich core materials. **Trionics Corp.**, $29,607 for research on heat-resistant elastomerics.

By Navy, Bureau of Ships: Stavid Engineering Inc., $56,194 for services of electronics field engineers.

By Navy, Purchasing Office: Arma Div., American Bosch Arma Corp., $52,800 for engineering services. **International Business Machine Corp.**, $42,000 for mylar magnetic tape. **United Aircraft Corp., Hamilton Standard Div.**, $103,224 for turbine starter. **Lukens Steel Co.**, $278,584 for steel plates. **Gilbert Dannehower, i/t/a High Precision Prod. Co.**, $55,663 for gear grinding machine.

By Naval Research Laboratory: Burroughs Corp., Electro Data Div., $42,355 for electro-data computer.

By Navy Dept.: McConathy, Hoffman & Associates, Inc., $71,885 for Burner Laboratory bldg.

By Navy, Office of Naval Research: Radio Corp. of America, $55,339 for development of high-power transistors. **University of Illinois**, $33,417 for research of extra-terrestrial radio sources.

By Naval Training Device Center: Sylvania Electric Products, Inc., $54,989 for automatic target tracking and intelligence data display device.

By Atomic Energy Commission: J. A. Tiberti Construction Comp., $815,572 for control building area. **Sierra Construction Comp., Inc.**, $2,058,355 for assembly-disassembly building. **Pittsburgh-Des Moines Steel Co.**, $107,360 for water storage tanks. **Petroleum Combustion and Engineering Co.**, $1,209,000 for test cell and tank farm.

Fred Galant and L. B. Wells of Visalia, $890,346 for access road. **Perry Brothers Drilling Co. of Flagstaff**, $89,325 for water supply wells. **J. L. Croft and Sons, Inc.**, $472,307 for roads. **Hansen Plumbing and Heating Co.**, $147,037 for water distribution system. **A. D. Schader Co.**, $252,036.09 for railroad facilities.

The ultra high strength steel

having highest strength-to-weight ratio at temperatures to 1000° F

VASCOJET 1000 is now in wide use by the aviation and missile industries for ultra high strength structural requirements over the temperature range from −100° to +1000°F, and in the transportation and other fields where exceptionally high tensile strength and toughness are desirable.

Today, VascoJet 1000 is supplied in a wide range of shapes and sizes: squares and flats up to 256 square inches of cross section, in sizes such as 16″ square or 28″ x 8″ with guaranteed center properties; all standard bar sizes; sheet and plate from .025″ up to ½″ thick, in standard widths up to 78″ and in lengths up to 180″; solid disc and ring forgings; all rod and wire sizes.

VascoJet 1000 is easily machined, deep drawn, stamped, spun, extruded, cold headed or hot forged. It is readily welded with full properties retained. Write us for Specification Sheets showing guaranteed properties of this remarkable steel.

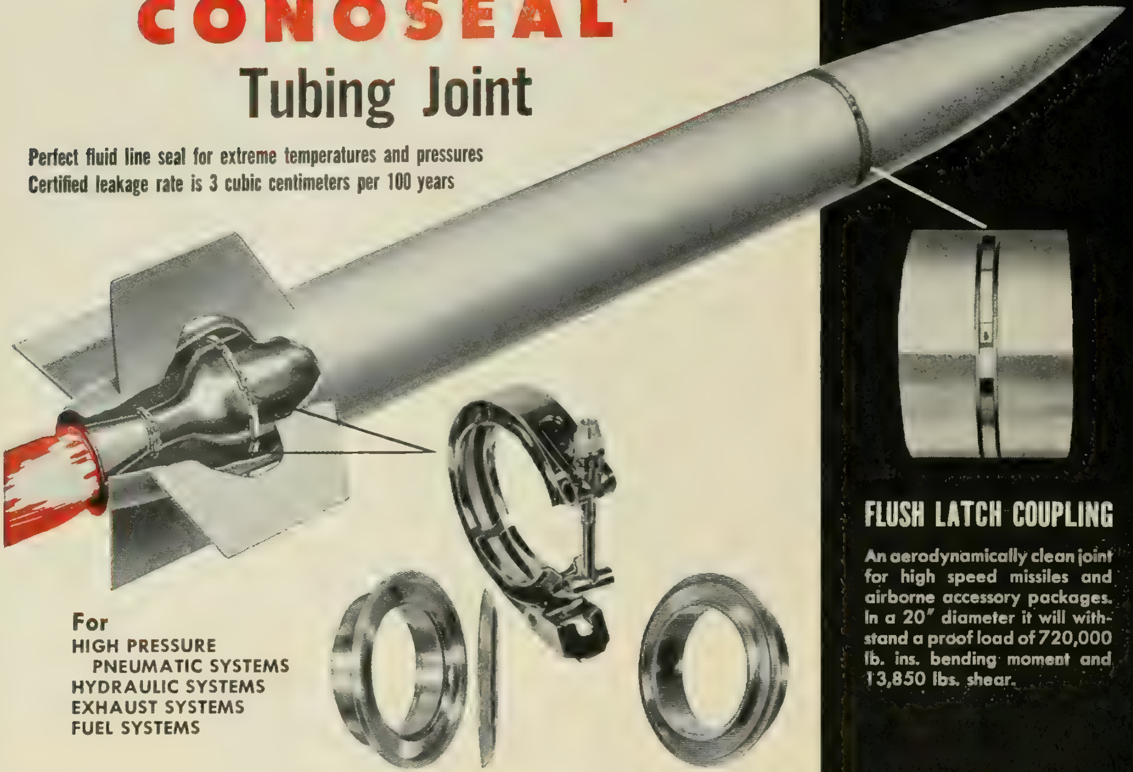
New All-Metal MARMAN CONOSEAL* Tubing Joint

Perfect fluid line seal for extreme temperatures and pressures
Certified leakage rate is 3 cubic centimeters per 100 years



For
HIGH PRESSURE
PNEUMATIC SYSTEMS
HYDRAULIC SYSTEMS
EXHAUST SYSTEMS
FUEL SYSTEMS

FLUSH LATCH COUPLING

An aerodynamically clean joint for high speed missiles and airborne accessory packages. In a 20″ diameter it will withstand a proof load of 720,000 lb. ins. bending moment and 13,850 lbs. shear.

The Marman CONOSEAL provides metal gasket compression with the flexibility and sealing qualities formerly obtained only through the use of organic seals. Dissimilar metals can be subjected to extremes of temperature and pressure with linear deflections up to 1/16 inch without sacrifice of a perfect seal. Light weight and low envelope clearance are plus advantages when the Marman CONOSEAL Tubing Joint is used. High compression loading is not required. Flanges are self indexing for ease of installation and restraint of shock load.

Marman's engineering department will analyze your coupling problems and furnish you with recommendations for the use of CONOSEAL on your applications.

Available in three different operating performance ranges −300° F. to +1800° F. Standard sizes from 1″ to 12″ O.D. tube size, with special sizes designed to your requirements.

MISSILE COMPONENTS Bulova safety and arming systems protect ground, air and sea crews from load to launch, then take over in flight. Safety factor of one in a million is specified and reliably delivered by Bulova's precision production facilities. Powder-driven gyros and fuzing systems are among other Bulova developments for 18 key missiles.

AIRCRAFT INSTRUMENTS Bulova's new Servo Altimeter assures maximum reliability through unprecedented sensitivity, accuracy and repeatability. At 40,000 feet, it detects 4-foot changes . . . is correct to 40 feet. Safety is improved in traffic control and flight over difficult terrain. As a control instrument, it is readily adaptable to guided missiles.

Bulova reliability helps to solve today's most challenging problems

For more than 80 years, Bulova has charted new courses in the area of reliability.

Milestones along the way are the electronic and electro-mechanical devices created by the Bulova capability—the uncommon blend of pioneering vision and precision production experience.

These Bulova developments, distinguished by their advanced design and consistent high performance, help our nation's defense and industry stake solid claims on the frontiers of science and space.

The high degree of Bulova reliability prevails from concept to mass production. For assistance with your systems and components problems, write: *Department G.I.S. 3, Bulova Park, Jackson Heights, New York.*

BULOVA
watch company

BULOVA RESEARCH AND DEVELOPMENT LABORATORIES, INC.

INFRA-RED COMPONENTS Bulova infra-red cells are designed to unerringly guide Sidewinders to target. Bulova-improved production processes increase yield and product reliability. Other infra-red developments include filters, reticles and thermistor bolometers, as well as advanced research in mosaic and lead selenide cells.

PHOTOGRAPHIC SYSTEMS Bulova's new high performance 70mm recon-camera features 8 frame/sec. and pulse operation . . . vibration-free exposures to 1/4000 sec. From the smallest 16mm gun camera ever built to units of 9x18" format size, Bulova developments include optical, data recording and instrumentation, and special sequence cameras.

Engineers and Designers interested in creative opportunities are invited to submit their qualifications to Dr. R. Hershey, Personnel Mgr., Bulova R&D, 62-10 Woodside Ave., Woodside 77, N.Y.

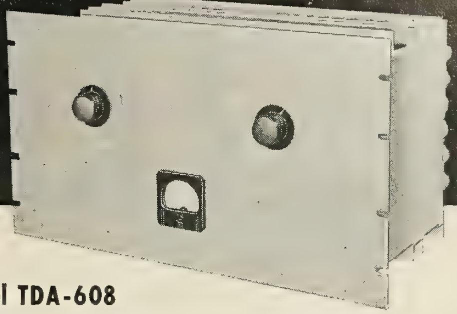
Bendix-Pacific
SUBCARRIER DISCRIMINATOR



Model TDA-608

HIGHEST ACCURACY...STABILITY... RELIABILITY for Data Processing

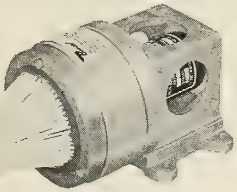
Through the use of computer-type high speed switching circuitry, a highly stabilized current source, a low-temperature coefficient quartz delay line and precision resistors and output low-pass filters, this discriminator offers the finest equipment for telemetering receiving stations and data-processing systems.

Each discriminator can be operated on any one of the 23 IRIG bands by a front panel selector switch or from a remotely located band switch. An automatic, transistorized servo-actuated zero and full-scale calibration feature is **optional** in this equipment.

Associated equipment also is available to compensate for wow and flutter components from magnetic type recordings, and filters to separate the composite subcarrier signal prior to input to the discriminator.

Bendix-Pacific Model TDA-102 Discriminator, a dual channel unit operating on any telemeter band with appropriate plug-in filter units, also is available.

NEW BENDIX-PACIFIC COMMUTATOR SWITCH
for PDM Telemetering Systems



Model: TSC — 200
Circuits: 2 independent sections of 90 contacts each
Speed: 20 RPS
Motor: 115 volt AC 400 CPS or 26.5 volt DC
Life: 500 hours (Total)
Temperature: —35°C to 85°C
Vibration: 25g to 2000 CPS
Acceleration: 75g any axis
Size: 4½" x 3⅜" x 3½" approximately
Weight: 2½ lbs. approximately
Wiring: Internal interconnections per IRIG standards for PDM, or Internal interconnections to customer specifications.
Other circuits and speeds can be provided upon request.

THE PRODUCTS OF THE MIND

The world we live in is in large part the product of the scientific thought and accomplishment of the past, translated into engineering achievements. Whether we continue to go forward depends on whether the scientific curiosity, the imagination, the careful thought, and the logical analysis of the past, upon which today's technical achievements were built, can exist and flourish in the environment of the new world.

At Avco Research and Advanced Development Division, and at other places in the free world, an atmosphere exists in which the inquiring mind may live and create. We have the technical assistance and the facilities by which ideas are converted into concrete accomplishments. Many things have been done, and infinitely more remain to be done—the world of scientific thought is unlimited and promising. From the products of the mind will come the technical world of tomorrow.

BURROUGHS NOW RECORDS AT 30,000 CHARACTERS PER SECOND

Today's high-speed electronic communications and data processing systems could not realize their full potential without high-speed *recording* . . . recording that translates electronic impulses into readable characters.

And that's where Burroughs developments in terminal equipment come in. Its electrographic read-out device on the receiving end of the messages automatically reassembles all their electronic impulses into printed words and characters—at a speed of 30,000 serial characters per second! And Burroughs high-speed recording gives you a choice of either matrix or preformed character techniques.

Our Armed Services' urgent need for high-speed recordings prompted Burroughs Corporation—whose commercial business necessitates many types of printing devices—to develop these tools. Fact is, Burroughs Corporation has successfully undertaken many other military projects, too—often seeing them through from initial research to final installation and field service. We welcome additional projects in all areas of our proved ability, including all phases of control systems and data processing involving electronic computation.

Write, wire or call Burroughs Corporation, Defense Contracts Organization, Detroit 32, Michigan.

WHY did we lose the race to outer space?

MARTIN CAIDIN tells the incredible story of our high-level bungling and of Russia's plan to control the earth from outer space in

Countdown for Tomorrow

Here is the story our "muzzled" scientists and military engineers were forbidden to tell—a first-hand report by the man who discovered the shocking facts behind the headlines and isn't afraid to tell the truth about Russian or American astronautic science. A hard-hitting, comprehensive, confidential report by one of our top science writers. Illustrated. $4.95

At your bookstore.

DUTTON

Propulsion Engineering

by Alfred J. Zaehringer

Look for new propellant materials. China Lake NOTS reports work on lithium hydroperoxide 1-hydrate. Other new propellant compounds coming out of the lab are lithium peroxide, boron-amines, alkyl borons, cyanogen, urazole and the organosilanes. Olin Mathieson is now producing commercial quantities of anhydrous hydrazine and also the aqueous grades; also being produced is the new hydroxyethylhydrazine (HEH) which is a good fuel and is hypergolic with certain oxidants. Pennsalt is introducing two new oxidants which may have considerable promise in solids: 3-nitroperchloryl-benzene and pehchloramide.

Lower-cost exotic fuels may be shaping up. Bellvue Laboratories of New York chlorinates cheap borax to make intermediate boron trichloride some 50% cheaper than existing high-temperature methods. It now takes about 10 pounds of the trichloride to make one pound of pentaborane or decaborane.

Propellant thermochemists will be interested in a program completed by AEC's Argonne National Laboratory. The thermodynamic behavior of many oxides, fluorides and chlorides has been determined to 2500°K and the data will be useful in determining the characteristics of rocket exhaust products and in finding pyrometallurgical methods for the separation of fission products from spent metallic nuclear fuels.

The Soviets have high-performance solid propellants. The last-stage rocket (used on both *Sputnik* I and II) used a large composite grain that delivered 0.75-1.0 million lb-sec. The sea-level specific impulse is estimated at about 273 sec. The average high-energy solid propellant now in use in the United States puts out about 225 sec at sea level.

More ammonium perchlorate for solid propellants is on the way. Pennsalt will produce the oxidant on the West Coast and at a site to be announced in the South. The process will be based on sodium chlorate as the raw material. Up to the present time, American Potash & Chemical at Henderson, Nev., was the sole U.S. large-scale producer. Now, with a blossoming of large solid rockets, more of this vital composite ingredient will have to be produced.

Nuclear rocket engine development will get a boost when Rocketdyne and the Air Force team up with AEC. The California firm has received a research and study contract with WADC on the atomic rocket. Present NAA atomic rocket view is quite conventional—an atomic pile which heats up an inert working fluid and exhausts it through a conventional nozzle.

Nuclear fuel elements for atomic rockets may be quite expensive. Based on present cost of \$15-\$30/gram for 90% enriched material (U^{235} or Pu^{239}), the fuel for a typical engine might cost over several hundred thousand dollars.

SAFE FLIGHT SAFE LAUNCHING

WITH CANNON HIGH-RELIABILITY PLUGS

Performance of missile launching connectors cannot be "hit or miss." Both safe launching and safe flight are required. And that's where Cannon's reputation for quality and design experience can help... with the most complete and most reliable line available.

Through proper care, analysis, and control, our Cannon organization can furnish missile quality to any AQL desired!

Cannon Missile Connectors have been developed to meet the specialized demands of the guided missile program. They are available in a number of basic shell designs built for heavy duty service, with a variety of different materials available as inserts. More than 22 contact layout arrangements accommodate from 8 to 140 contacts. Coaxial, thermocouple or high-current-capacity contacts also available.

For complete information write for Bulletin on Guided Missile Connectors... or contact our factory engineers for assistance in solving your particular problem.

Rocket engine thrust—
precision measured by B-L-H Load Cells

It takes rugged, yet highly responsive, instrumentation to measure the explosive thrust of a rocket engine on test. B-L-H has solved this problem completely and accurately with its SR-4® Load Cells, mounted in a specially designed test stand of its own. The thrust of the anchored engine is exerted against the load cells. Instrumentation, which can be located at some point remote from the stand, gives moment-by-moment visual readings on dial indicators—or makes records of the performance on graphic recorders, digital printers, computers, etc.

Electronic transducers offer you the answer to virtually any testing or research problems involving tension, compression, torque, etc. With appropriate instrumentation, they can also determine center of gravity, weigh loads at rest or in motion, control batch and continuous processes, and record all data required. Long-term accuracy is within ± 1/10%, repeatability within ± 1/20%.

For more information on B-L-H electronic transducers —load cells, pressure cells or torque meters—ask to have one of our field men call, without obligation. And write to Dept. 9-D for a copy of Bulletin 4300.

A report to Engineers and Scientists from Lockheed

...WHERE EXPANDING MISSILE PROGRAMS INSURE MORE

NEW SHOCK TUBE TESTS MISSILE DESIGNS FOR POLARIS

This huge new shock tube, performing basic research and providing ballistic missile design data at speeds up to 20,000 feet per second, is now in operation at the Division's research and development laboratories.

The 44-foot long tube is used for advanced design work on the Polaris, a solid propellant weapon to be launched from submarines.

Temperatures and pressures generated within the tube will simulate those encountered by a long-range ballistic missile as it plunges from space into the earth's dense blanket of air. Shown preparing a test in the shock tube are Dr. Daniel Bershader, center, Manager of Gas Dynamics Dept., with scientists Jerry D. Kennedy, left, and Wayland Marlow III.

Missile Systems

PROMISING CAREERS

Lockheed Missile Systems is in the forefront of U.S. missile developers. For example, projects like the Polaris strategic ballistic missile are proof of Lockheed's leadership in solid fuel weapons systems.

Work on Polaris—and a giant earth satellite under development by Lockheed since 1955—has led Division scientists and engineers into the most sophisticated areas of research and development. Highly advanced facilities in our multi-million dollar laboratories, near Stanford University, provide the ideal technical environment.

As more emphasis is placed on missile's role in U.S. defense, activities within our missile programs—like those pictured here—will inevitably grow. This means better opportunities for you to move rapidly ahead in your career.

Positions are open on all levels in: **Aerodynamics, Thermodynamics, Guidance, Propulsion, Flight Controls, Inertial Guidance, Electronics, Ground Support, Information Processing, Structures, Human Engineering, Systems Integration, and Materials Research.** Qualified engineers and scientists are invited to direct inquires to M. W. Peterson, Research and Development Staff, Sunnyvale 7, California.

HOW LOCKHEED HUMAN ENGINEERS HELP MISSILES FLY BETTER

Polaris and other major Lockheed missile systems "fly" better through efforts of Division human engineers like Dr. Joseph W. Wissel, left, and Dr. John E. Mangelsdorf, right. They are shown with Flight Control Analysis engineer Roy J. Niewald, collecting flight control accuracy data on a display parameter.

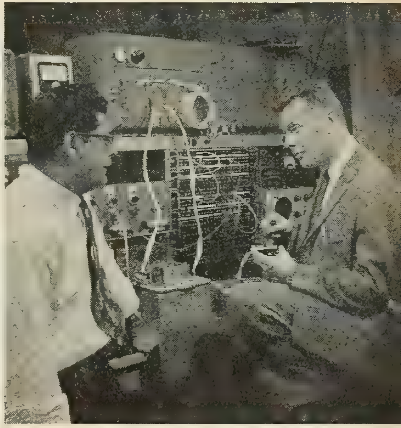
Studies of man-machine systems like the missile control station enable engineering-psychologists to develop advanced equipment which minimizes the opportunity for human error.

Missile flight control is one of the challenging problems which human engineers—working with other Lockheed scientists and engineers—solve in this era of complex missile systems.

PAIR OF UNIVACS SOLVE TOUGH DESIGN PROBLEMS

Two Univac Scientifics today aid preliminary design work for Lockheed missiles by solving tough flight simulation problems at Division laboratories, Palo Alto. These high speed digital computers aid in the study of missile characteristics, performing scientific and engineering calculations and data reduction by means of the most advanced techniques.

Above, Dr. J. P. Nash, left, and R. V. Middleton review instructions at a Univac control console before starting problem. The $1½ million computers are part of an installation which is one of the largest and most complete in the West.



LMS ENGINEERS DEVELOPING TRANSISTOR FLIGHT CONTROLS

Transistorized flight control systems for the Polaris ballistic missile program are being tested and developed under the direction of Gene Schott, Flight Controls Department Manager, right. Schott is shown discussing results of a recent test with design engineer Carlos Avila.

Transistorization of missile control systems is receiving top attention from Lockheed Missile Systems engineers and scientists in the interest of saving weight and space over present flight control systems. This work is being conducted in the Division's Palo Alto and Sunnyvale laboratories.

BRUNSWICK IS *HONEYCOMB HEADQUARTERS!*

Leading producers of military aircraft regard Brunswick as the prime supplier of compound contoured honeycomb components. Here, in ultra-modern facilities, every phase of production is held well within the specified tolerance limits by research teams and personnel that are both able and experienced.

Availability of four huge autoclaves demonstrates the capability of Brunswick to cure assemblies requiring constant temperatures up to 500° Fahrenheit, pressures up to 150 PSI, and vacuum to 28 inches of mercury. These are typical of the topflight facilities that always give you the best at Brunswick.

Whatever your problem in metal honeycomb, conventional metalwork or in reinforced plastics, Brunswick can do the complete job . . . from design right through fabrication and testing. Write today to: The Brunswick-Balke-Collender Company, Aircraft Division, 623 S. Wabash Avenue, Chicago 5, Illinois.

MAGAZINE OF WORLD ASTRONAUTICS

Old German Concept Becomes Reality:

Navy Pushing New *Subroc* Missile

Termed "ultimate" weapon by officials

By Erik Bergaust

Reliable sources have confirmed that the Navy is conducting a bidding competition for a new weapon to be called *Subroc*, or submarine-launched rocket. First use of the weapon would be for antisubmarine warfare but it could also be employed against other targets.

Faced with the prospect of not having operational *Polaris*-launching subs much before 1961 or 1962, the Navy will use the *Subroc* as its major submarine-type weapon at least until then. Washington officials have already dubbed the *Subroc*, "the interim ultimate weapon."

The Navy reportedly invited bids from 64 companies and received proposals from 29. Of the 29, about half will be asked to resubmit proposals in more detail and with dollar signs attached. This last action is scheduled to take place sometime between the middle of April and the 1st of May. Contracts will be let then and development will get underway.

Subroc based on an old German concept, is initially designed to be an underwater-to-air-to-underwater antisubmarine weapon. Reportedly Navy has set aside more money for this weapons system than any other except *Polaris*. Advantage of the weapon is that it is designed to be launched through conventional 21-inch torpedo tubes. Future plans for *Subroc* include its use as a tactical underwater-to-air-to-surface ballistic missile, and as an underwater-to-air antiaircraft and anti-missile weapon. Initial development, however, will be on the antisubmarine weapon.

Subroc will probably be somewhat similar to *RAT* in basic concept—a rocket booster for a sonar homing torpedo. Opportunities for business for missile metal machining firms will be considerable. *Subroc* will have at least four separate powerplants:

It will have a small motor to get it near or to the water surface, it could be a rocket—or turbine-powered propeller. At surface, main booster stage will fire. This will be conventional solid-propellant motor. *Subroc* will also carry a system of small retro rockets to help fix its ballistic trajectory. These will probably be liquid (hydrogen peroxide-potassium permanganate). Big solid-propellant motors will contain jetavators for guidance. Final propulsion system will be another underwater unit—either a conventional torpedo engine or a hydroduct (underwater ramjet) or a rocket motor.

The most striking feature of the *Subroc* is that it is to be designed for launching through conventional torpedo tubes, eliminating the problem of separately designed launchers as in the *Polaris* program. Most existing subs could be used immediately, including the three nuclear subs now afloat. Future *Albacore*-type subs would need no modification to carry *Subroc*.

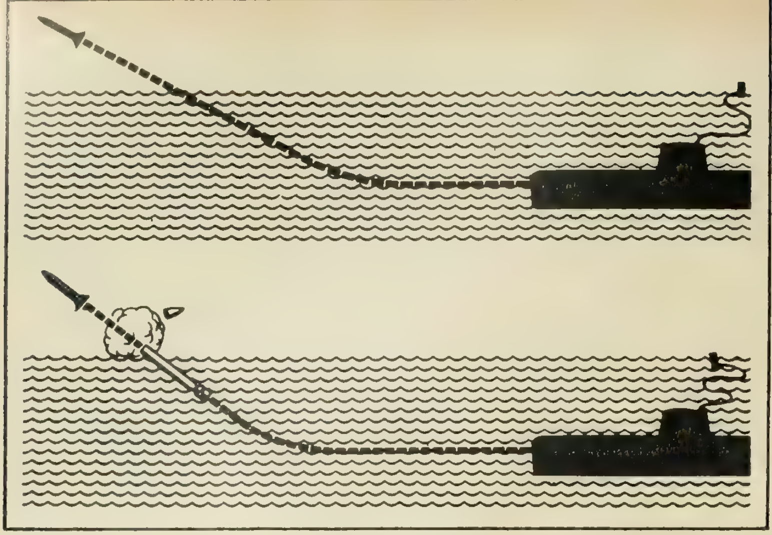
The *Subroc* is described as a torpedo-type weapon capable of being launched from a 21-inch torpedo tube. It is fired under water but takes to the air, using inertial guidance in flight, with an acoustic homing system cutting in when it re-enters the water. Targets would be programmed into self-contained guidance computers and would presumably be easy to insert or change if required.

The weapon will use a solid-propellant rocket for propulsion with jetavators for control and retro rockets for proper power adjustments to achieve a ballistic course. The warhead is said to be nuclear or thermonuclear, giving the acoustic homing and inertial guidance and control systems much greater leeway in finding the target because of the

Reds To Fly Atomic Airplane Soon

CHICAGO—Soviet nuclear rocket research is progressing "nicely" and their atomic-powered airplane will be flying "soon," according to Soviet scientists who visited the Nuclear Congress and the Atomic Exposition in Chicago last month. Nuclear rocket propulsion has been discussed openly in recent years by Soviet scientists. A meeting delegate said a Russian scientist had told him "we're probably ahead of the Americans in this field."

Several technical papers on nuclear propulsion for aircraft were presented at the Nuclear Congress. Simultaneously—at the semiannual meeting of the American Rocket Society in Dallas—four papers on nuclear rocket propulsion were given. ARS members expressed their hope that this country get a nuclear rocket program under way instead of the "nibbling" currently taking place. There was considerable criticism of how the military and the AEC had contributed to the delay of such programs.



SUBROC-TYPE missiles as conceived by the Germans in 1944.

hugely expanded kill radius possible.

With the current threat posed by Russia in the submarine warfare area, the Navy looks to the *Subroc* as a powerful deterrent. Russia now has somewhere in the vicinity of 500 submarines compared to our 100-odd active and 50 odd in mothballs so a weapon such as *Subroc* can act as quite an equalizer. In combination with airborne spotters, its range is probably something like 200 miles. This minimizes a trouble common to antisubmarine warfare—mistaking your own subs for those of the enemy.

Submarine warfare is complex and has many phases but the significant point about the *Subroc* is that it can be fitted into the existing structure without any modification to existing equipment. It can be carried by present-day subs, it can utilize nuclear warheads developed for other missiles, it can use existing elements of antisubmarine warfare such as blimps, patrol planes and sonar buoys, and it can draw on the missile industry for its component parts such as the rocket engine, the inertial guidance and the sonar guidance.

Antisubmarine warfare is the first use of the *Subroc*, but Navy planners see much more in the future. One suggested application would be a fleet of submarines launching *Subroc*s to clear an area in enemy territory for invasion, leaving a "clean" corridor for our forces. Another is for submarine-to-air using infrared homing.

Subroc is another indication of the Navy's real determination to stay in the missile business. The *Polaris* program has already sounded the death knell for land-based IRBMs and rumor has it that the Navy is thinking of a doubled-range *Polaris* which could revolutionize ICBM warfare. Now, with tactical uses such as pre-invasion softening and anti-aircraft, the *Subroc*, because it does not require any new supporting equipment, might well secure another chunk of the nation's defense complex for the Navy.

Couple *Subroc* with conventional torpedoes, rocket-assisted torpedoes, the *Polaris*, and an extended-range *Polaris*, and you have a missile system which can do just about everything in point-to-point tactical warfare. Navy officials have indicated they are pushing a plan to station a number of *Subroc*-type subs under the polar ice pack for instant retaliation. Experts seem to think it would be impossible for an enemy to spot these subs.

Army Secretary Witnesses Third *Explorer* III Launch

With Secretary of the Army Brucker and leaders of the Army missile team for an audience, *Explorer* III roared into space at 12:38 p.m., March 26 to join America's other two satellites in orbit.

Some 83,000 pounds of thrust provided by the *Jupiter* C first-stage's new high energy fuel, hydyne, lifted the four-stage vehicle off the launching pad at Cape Canaveral. The second, third and fourth stages which carried the satellite into orbit was made up of a veritable company of scaled-down *Sergeant* rockets.

The 80-inch long, pencil-shaped satellite weighing 31 pounds was packed with equipment to measure and transmit data on cosmic rays, micrometeorite activity, and temperatures. In addition, *Explorer* III carried a small tape recorder which could store information during flight and transmit it to a ground station on command. (See *Explorer* data story, page 47).

Extension o

by Frank McGuire

The Navy has a crash program in the works to foil the effectiveness of the Soviet undersea fleet. Known as the HERALD system, this is a massive, passive sonar installation; a harbor electronic ranging and listening device. Originally intended to protect harbors from undetected enemy submarines sneaking into a strategic port, the HERALD system is now being extended and improved to protect long stretches of strategic coastline against missile-launching submarines. (m/r, May, 1957).

Existence of the HERALD system was admitted, apparently accidentally, in a basic handbook for Naval officers. The handbook, on sale to the public through the Government Printing Office, indicates that the HERALD has been under development, and perhaps even in use, since World War II.

The Navy is pushing antisubmarine warfare to the utmost and beginning to release small amounts of information on the results of its developmental efforts in this field.

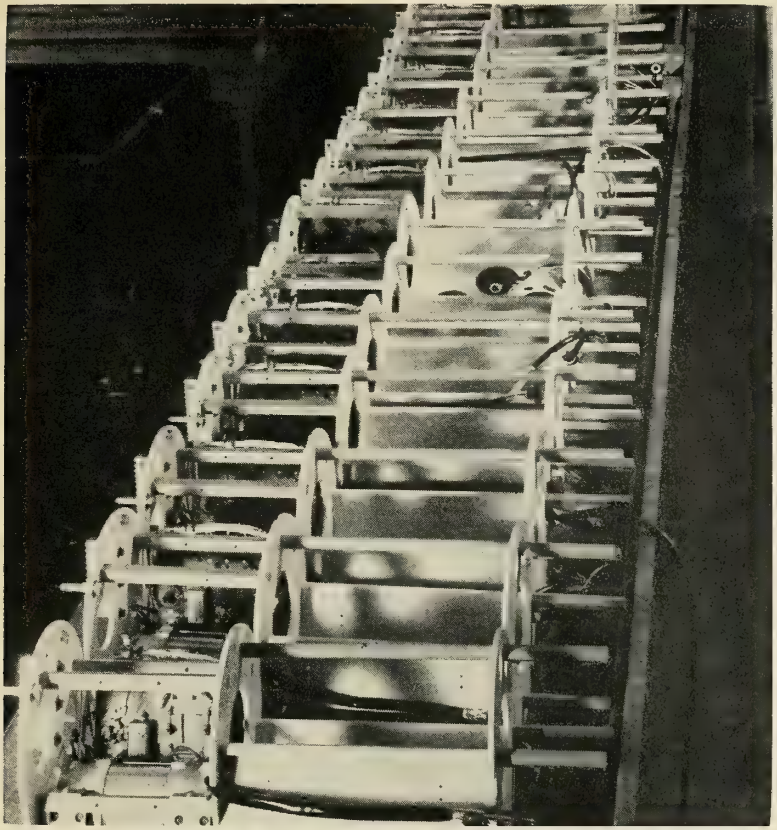
But the motto "silent service," is being carried through all phases of the submarine and antisubmarine program and is responsible for the tightest security measures in the U.S. defense setup.

It has become more difficult to obtain information regarding an obsolete torpedo than to get data on our latest bombers and missiles. The existence of the MK 32 torpedo, for example, was finally acknowledged to the press on January 15, only one day before the Navy announced that is was obsolete. Production of the MK 32 ceased in 1955.

Despite security precautions, however, the Navy is known to be working on several types of antisubmarine warfare (ASW) devices. The same heavily shrouded torpedoes loaded aboard submarines are openly mounted on destroyers tied up in domestic and foreign ports. The MK 43 *RAT* combination is a case in point since it is mounted on a standard 5-inch gun turret aboard Navy destroyers.

The MK 43 is expected to be followed by a more advanced version said to incorporate greater range, speed, accuracy and operating depth. This new weapon, probably to be called the MK 44 antisubmarine torpedo, is obviously under development by General Electric and under a pending $3.4 million contract, for more than 100 units which may go into prototype and pilot

HERALD Systems Planned



PARTIAL AFTERBODIES of the MK 43 torpedo rest on the line at the Naval Ordnance Plant in Forest Park, Ill. awaiting completion. The Mk 43, a rocket-assisted antisubmarine torpedo, is being replaced by the General Electric Mk 44 torpedo.

production at the Forest Park, Ill., Naval Ordnance plant sometime this summer. A great deal of plastic, glass fiber and electronic equipment is used to achieve lightweight construction and still maintain accuracy.

In sharp contrast to the 21-in.-diameter, 21-ft.-long standard submarine-launched torpedo, the MK 44 will be about a foot in diameter with a length of about eight ft. Two contra-rotating propellers which have a blade length of approximately two inches, but with an extreme pitch, are apparently cast of a lightweight metal such as aluminum. One annular stabilization ring is mounted at the rear of the fish.

According to the best guesses, the MK 44 will be rocket-assisted as is the MK 43, and can also be air-dropped or helicopter-launched. It is said to be quite reliable, but is intentionally not so refined as to be able to strike a beer can on the bottom of the sea. "Otherwise," said one engineer, "the enemy might litter the whole damned area with beer cans." However, the MK 44 is persistent—one model under evaluation reportedly made 13 passes at a target before scoring a hit.

The number of antisubmarine weapons using rocket power is growing. The *RAT* is actually an elementary form of rocket-boosted weapons, but future variations will be much more sophisticated and effective. ASROC, or antisubmarine rocket, a greatly advanced type of rocket-assisted torpedo, is being developed by a number of contractors, among which is GE, one of the bigger torpedo producers.

ASTOR, antisubmarine torpedo or atomic submarine torpedo, is a multi-mission weapon capable of carrying an atomic payload. It is believed to be based on a vehicle the size of a MK 18 torpedo. On this weapon system, the interchangeable warhead could be designed to accomplish a variety of tasks. One mission of the atomic-warhead torpedo would be as a supersubmarine killer with a great kill radius.

• **Propellers still tops**—Despite the exotic experiments being undertaken with underwater rocket-powered torpedoes using widely acclaimed infrared detection, there seems to be little immediate future for any operational weapons except those utilizing propeller-driven torpedoes guided by acoustics. Recent advertisements in trade magazines have praised the efficiency of underwater infrared detection, but information is lacking due to "security."

General Electric is understood to be testing an underwater shape with speeds in excess of 100 knots. It is apparently finding difficulty in effectively utilizing this speed.

The *Caribe,* another proposed antisubmarine weapon, would be a very fast, small torpedo with a light payload that might not sink a battleship, but would certainly punch large enough holes in a submarine to make it impossible for the submarine to voluntarily remain submerged long—if it expects to come up at all.

A major scientific complaint that has been made against Navy policy in the realm of ASW is the inbreeding that results from refusing to let industry actively take a part in basic approaches to the problem. There is no corresponding competition such as exists in the aircraft industry. Most torpedo development work is done by regular Navy installations, and the results are given to industry for development and production.

The Navy's past doctrine of having a strong "force in being" to combat war when and where it should occur has withered. This policy has now been most closely associated with the Air Force, while the Navy develops new weapons for antisubmarine work, produces a few at its Forest Park, Ill., Naval Ordnance Plant, and then puts the "production package" on the shelf to await a war.

The seagoing Navy thus gets a few new weapons to train with and conduct exercises with, but a wartime quantity is not expected to come through until wartime. The Navy, in the words of torpedo experts, is "expecting to win the next war the way we won the last one—through a huge production effort after hostilities have started. I wonder when they'll realize that they will fight the next war with what is actually in their hands on the day war breaks out?"

One of the prime causes of this situation is the severe budget limitation placed on the Navy. There is little reason to believe that the Red undersea fleet is any less dangerous than the air fleet. Projects like the HERALD system may detect a number of these submarines, but what operational weapon can prevent their success?

Vanguard—Long Countdown Succeeds

by William O. Miller

An important check point in the long countdown called Project *Vanguard* was written off as a complete success March 17 with the launching of a small test ball.

The St. Patrick's Day shoot was but one of the thousands of check points in the *Vanguard* program, which began over two years ago, and will continue for almost another year. As in the launching of a single vehicle, difficulty with any one of the components or adjustments delays the firing, so did the two previous tests temporarily halt the forward movement of the program.

Although the two previous attempts—one in December and one in February—did not place a satellite in orbit, nor even prove the launching vehicle, their failures were not unexpected and each of them contributed to the successful shoot.

The fact that the two previous shoots were in actuality "tests" seem to have been lost to the general public. Even on the day of the successful launching, Dr. John P. Hagen, Director of the project, declined to promise that the next scheduled launching would be successful.

However, the conditions under which the scientists and technicians of the Navy, the prime contractor—The Martin Company, and the International Geophysical Year worked for the last five months preceding the successful launching were most difficult in an almost unprecedented way. For almost two years the *Vanguard* program had progressed according to the plan of the U.S. National Committee for the IGY. Then, with the Russian announcements of *Sputnik* I and *Sputnik* II the *Vanguard* team was committed publicly by the highest office in the nation to a delivery incompatible with any scientific endeavor, particularly of an experimental nature. While this had little effect on the actual timing and scheduling of tests, the psychological pressure brought to bear on those responsible cannot be ignored.

• **Actually On Schedule**—Significantly, even with the two unsuccessful attempts, Project *Vanguard* is but very little behind schedule, as it was outlined over two years ago. At that time it was announced that an attempt would be made in the spring of 1958 to place a satellite in orbit. At the time, that in itself was a bold statement in view of the experimental nature of the project.

In any event, it is apparent that the old saying "nothing succeeds like success" is still valid. From a public apathy bordering on ridicule and threats of congressional investigation, the March 17 shoot has brought to those responsible the justified admiration of the scientific world and the renewed confidence in the free world's ability to take its place in space. Now it is acknowledged that never before in the history of rockets has such a complex and sophisticated vehicle gone from the drawing board to orbit in such a short time—a little over two years. This is even more impressive in view of the fact that *Vanguard* embodied many untried concepts and innovations, and did not have an unlimited budget. In brief, *Vanguard* delivered the planned payload with the planned thrust, with a little to spare, and within reasonable margins of the time scheduled.

• **Fired As Planned**—In discussing the launching, with m/r J. Paul Walsh, Deputy Director of *Vanguard* and the man in charge of the team at Cape Canaveral which launched the vehicle, said components and fuels used were as originally planned and that contrary to a rumor, no high energy fuels were used in the first stage. He went on to say that the vehicles to be used in the other seven firings scheduled for the remainder of the program will be basically of the same design as the one which put the 3.25-pound test ball in orbit.

"Success or failure is dependent on so many small things," Walsh said, "One small valve failure can spell failure for the entire operation."

Voicing the sentiments of the entire team he concluded:

"Months of extremely hard work and analyses of troubles have finally paid off."

All seven of the remaining satellites to be used will be equipped with the environmental study equipment which will measure and transmit information on air densities, temperatures, contact with meteorites and erosion effects. Actually, the test ball put in orbit March 17 was an extra dividend, as the firing was mainly to test the launching vehicle. The next launching will attempt to place the first *Vanguard* fully instrumented scientific satellite in space. All seven also will embody the Minitrack equipment for determining the positions of the spheres in their pre-determined orbits. All the spheres except one will be 20-inch magnesium spheres supplied by Brooks & Perkins Inc., of Detroit. The exception will be a 13 inch sphere of fiber glass laminate to be used in measuring the intensity of the earth's magnetic field.

• **Four Experiment Groups**—All of the information the scientists will seek falls into four categories at present. The final decisions as to just what components and experiments will be built into each satellite will be determined by the U.S. National Committee for the IGY. Actually, there are more proposed experiments and their necessary components than can be put into the remaining seven satellites.

As of now, the following information will be sought:

Group I—Measurement of the solar radiation in both the Lyman Alpha range and the X-ray spectrum. Two of the packages (the actual test sphere and a spare) will incorporate X-ray detectors in place of the Lyman Alpha detectors. Here, as well as where required in the other spheres, the Naval Research Laboratory will provide the sphere shell, the telemetering system, the Lyman Alpha detectors, telemetry, transmitter and antenna system.

Group II—Measurement of the cloud cover of the earth. By use of two infrared optical systems, the distribution and movement of clouds covering the earth will be determined. The optical system and telemetry is being developed by the Evans Signal Laboratory.

Group III—Measurement of the earth's magnetic field above the ionosphere. This is a NRL experiment, Dr. James Heppner in charge. The measurements of the magnetic field intensity will be accomplished through use of the fiber glass laminate sphere and a magnetrometer amplifier to be supplied by Varian Associates.

Group IV—Radiation balance experiment. This experiment, under Dr. Verne Suomi of the University of Wisconsin, will measure and compare solar energy or radiation from the sun to the earth and the radiation emanating from the earth, covering most of the range of the sun's energy. Detectors and telemetering encoders will be supplied by the University of Wisconsin.

In the original planning, Group II was the cosmic ray experiment which was developed by the State University of Iowa. This experiment was incorporated in the *Explorer* I launched by the Army. It also was included in *Explorer* II, which didn't orbit.

VANGUARD... the U.S. Missile in the News

Patience and perseverance paid off on St. Patrick's Day for the *Vanguard* program. TV-4, the sixth in the series of test vehicles, roared from its pad at 7:15.41 AM and successfully launched its baby satellite into an honorable orbit.

Shortly before the launching, the Navy reemphasized that the small satellite was put into the rocket for purposes other than putting it into orbit. The Navy said *Vanguard* I went along on the flight for the following reasons:
1) To determine by the satellite radio signals the rate of acceleration of the third stage rocket.
2) To test the satellite ejection mechanism.
3) "To take advantage of the *slight* possibility that an orbit might be obtained from a test flight. This, emphatically is not the principal reason for the inclusion of the sphere in TV-4."

Dr. John P. Hagen, project director said that some parts of the *Vanguard* rocket "will surely be used in the more imaginative things that will be done in the next few years."

The total cost of the *Vanguard* to date is $112.1 million. Of this $46.3 million has been appropriated to the Defense Department; $18.4 million to the National Science Foundation; $4.4 million to DOD-Naval Research Laboratory for logistic support; $34.2 million as a supplemental appropriation for the overall program; $2.5 million, "miscellaneous"; $2.1 million for Moonwatch program. Of these totals, the rocket cost (Martin Co.) comes to $47.06 million. And $60 million goes for minitrack

stations, data reduction (IBM), satellites, instrumentation, etc. Chronologically, Project *Vanguard* started out in September 1955 with an estimated cost of $10 million. In March, 1956 this was raised to $28 million; in July 1957, to $110 million and in March, 1958, to $112 million.

Satellite Statistics

	Sputnik I	Sputnik II	Explorer I	Vanguard I
Size—	22.8" dia.	19 ft. length	80" length	6.4" dia.

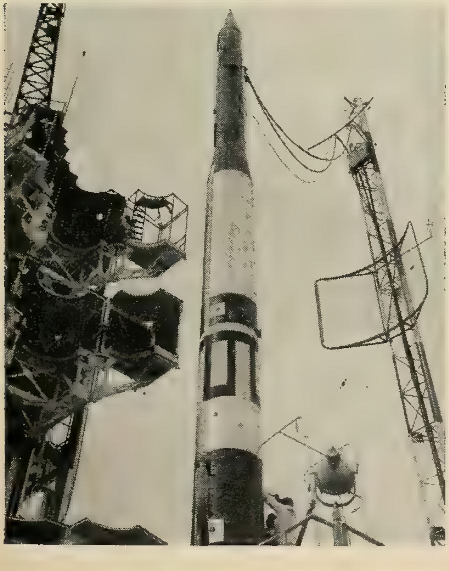
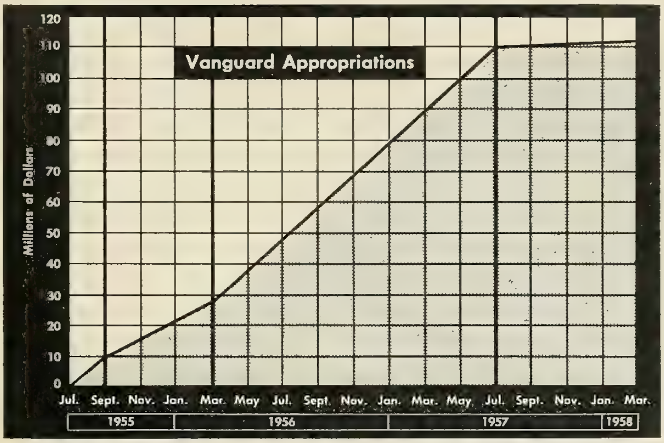
Sputnik I—Launched Oct. 4, 1957. Disintegrated first week in January after circling the earth about 1400 times.

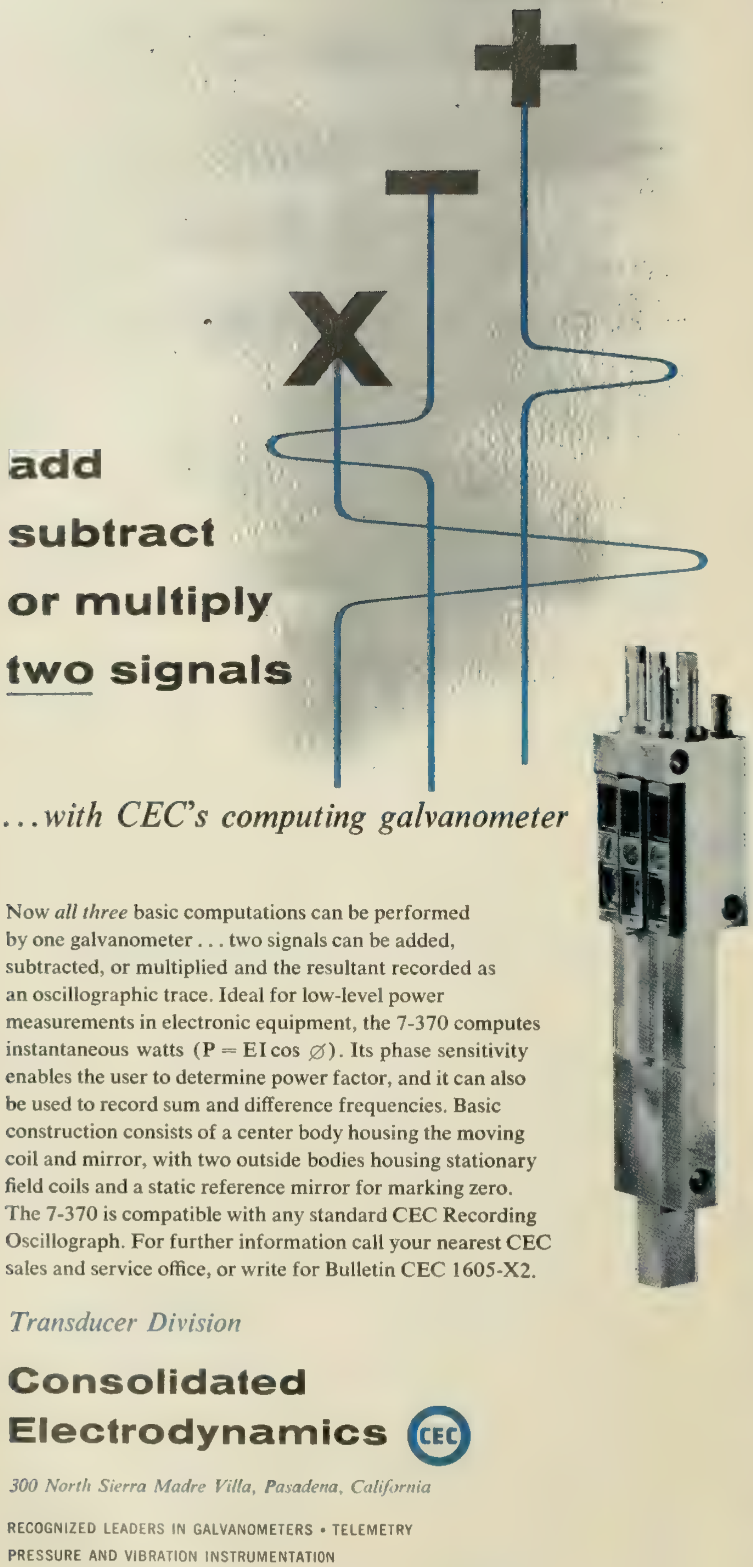
Sputnik II—Launched Nov. 3, 1957. Still circling the earth. Expected to fall in April.

Explorer I—Launched Jan. 31, 1958, 10:58 PM.

Vanguard I—Launched March 17, 1958, 7:16 AM.







add
subtract
or multiply
two signals

. . . with CEC's computing galvanometer

Now *all three* basic computations can be performed by one galvanometer . . . two signals can be added, subtracted, or multiplied and the resultant recorded as an oscillographic trace. Ideal for low-level power measurements in electronic equipment, the 7-370 computes instantaneous watts ($P = EI \cos \varnothing$). Its phase sensitivity enables the user to determine power factor, and it can also be used to record sum and difference frequencies. Basic construction consists of a center body housing the moving coil and mirror, with two outside bodies housing stationary field coils and a static reference mirror for marking zero. The 7-370 is compatible with any standard CEC Recording Oscillograph. For further information call your nearest CEC sales and service office, or write for Bulletin CEC 1605-X2.

Titan Cooling Units Called Biggest Built

The first of three air-conditioning units to be used in connection with ground operations of the *Titan* ICBM has been completed by the C. G. Hokanson Co., Los Angeles, Calif., for The Martin Co., Denver, Colo.

Said to be the largest self-contained air-conditioning and water-chilling system ever built in the United States, the 25,000-lb. unit was completed just 63 days after receipt of the order from Martin.

Under continuous-duty conditions, the conditioner will deliver temperatures below 0°F, providing ambient design conditions exist. It is said to be capable of delivering moisture-free air to within approximately six grains of absolutely no moisture content, and will perform to the required specifications at altitudes from sea level to 6000 ft. If temperatures are below zero, the unit can heat the air to 120°F. After the desired conditions have been determined, automatic controls are provided to hold the conditions automatically and indefinitely.

Air Force to Launch Animal Satellites

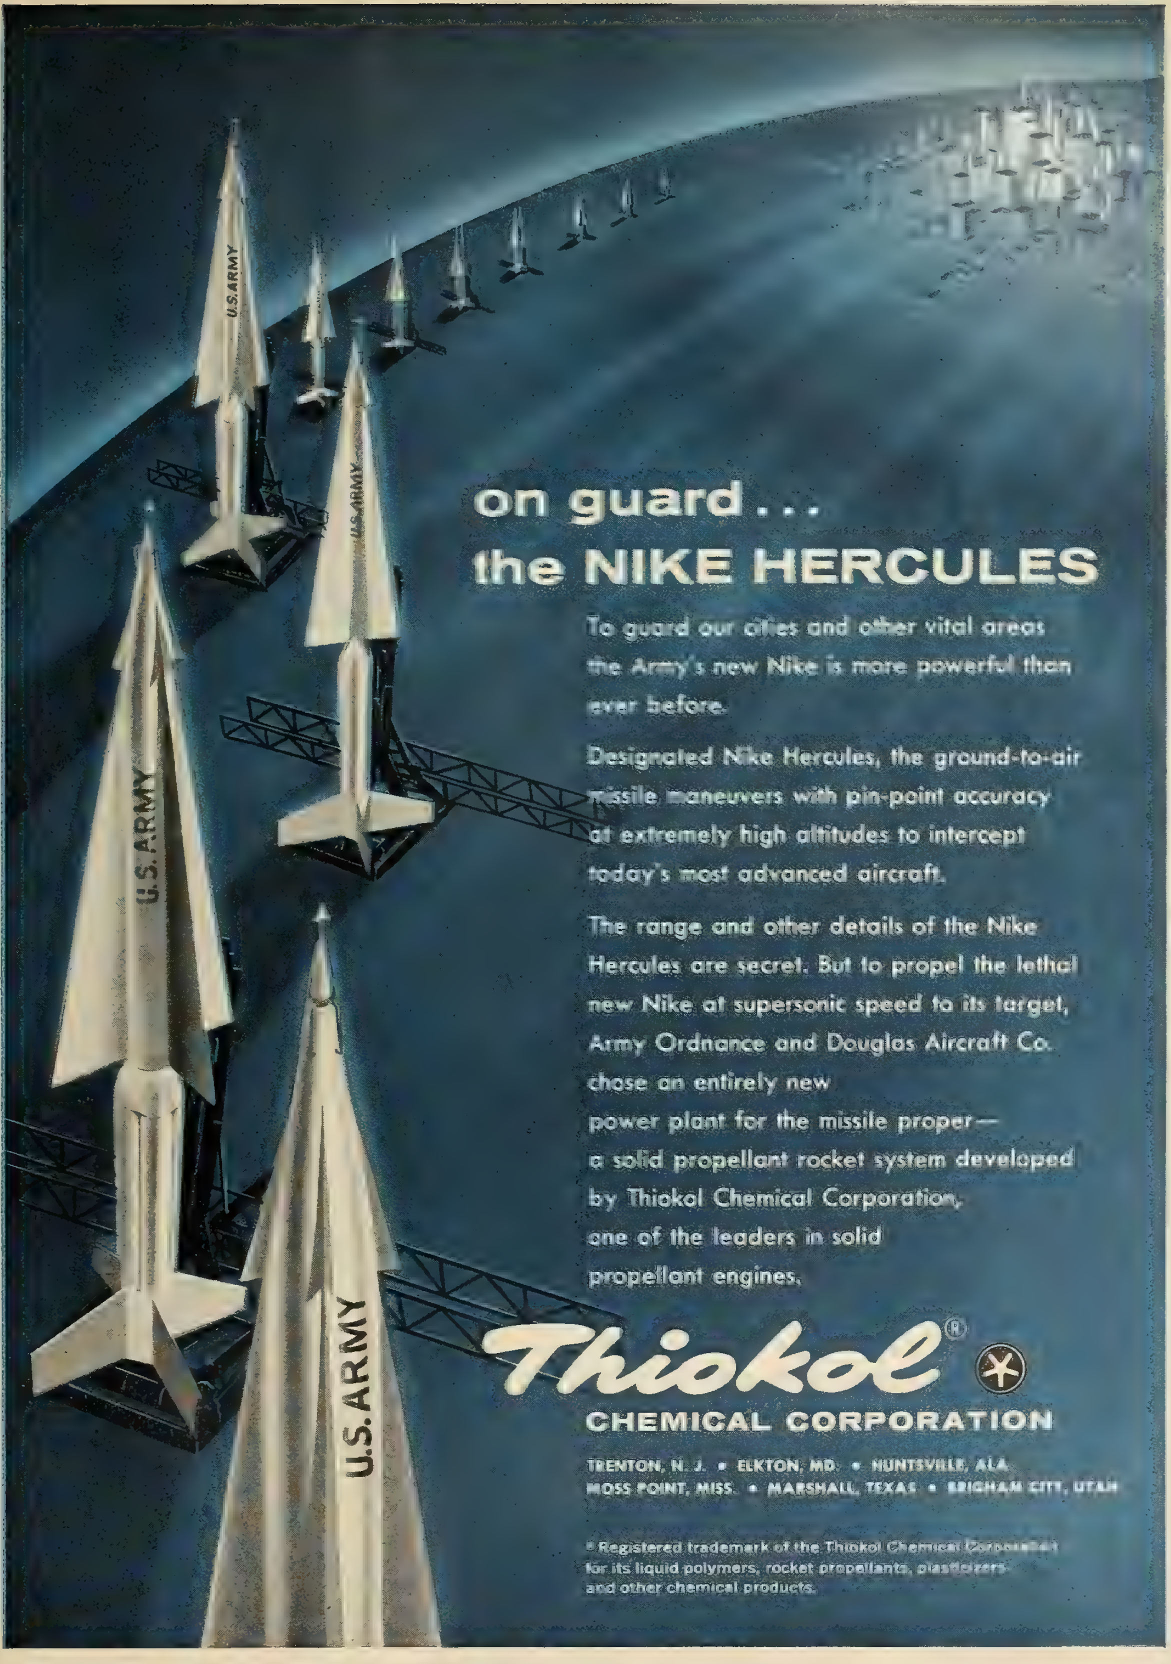
The Aeromedical Field Laboratory at Holloman AFB has requested manufacturers' bids on an animal survival capsule to be ready for launching into an orbit by October, 1958. The capsules, to be less than 24 inches in diameter, are cylindrical and must weigh less than 200 lb. Survival equipment for 30 days must be included. A total of six capsules will be delivered by August, 1958, and will be launched at the rate of one a month commencing in October. Bids will be for study, design, development and production of the units.

Navy to Let Contract for Liquid Rocket Engine

Although the contractor has not yet been announced, the Navy plans to let a contract for a liquid rocket engine to be used as an auxiliary in fighter aircraft.

Details of the competition have not been released but the engine will be a throttlable powerplant designed for installation in the tail of the aircraft. It will be similar to the British *Napier* design, and will use the same fuel as the AR-1 engine developed by Rocketdyne and being tested in the FJ-4F *Furies*. The AR-1 burns hydrogen peroxide and conventional JP-4 fuel.

The aircraft in which the new engine will be used has not been released.



on guard . . . the NIKE HERCULES

To guard our cities and other vital areas the Army's new Nike is more powerful than ever before.

Designated Nike Hercules, the ground-to-air missile maneuvers with pin-point accuracy at extremely high altitudes to intercept today's most advanced aircraft.

The range and other details of the Nike Hercules are secret. But to propel the lethal new Nike at supersonic speed to its target, Army Ordnance and Douglas Aircraft Co. chose an entirely new power plant for the missile proper—a solid propellant rocket system developed by Thiokol Chemical Corporation, one of the leaders in solid propellant engines.

U.S. AIR FORCE
VOODOO

Number One of a Series

EDWARD M. "BUD" FLESH, Senior Project Engineer of the F-101 Voodoo airplanes, has been in charge of the design and development of these Air Force fighters since their inception. Bud's abiding faith in his engineering team and in the Voodoo itself, has been a dominant influence toward the success of this project. A native son, graduate of Missouri University, he joined the McDonnell organization in 1946.

Range and reliability, two outstanding performance features of the F-101 Voodoo, were dramatically demonstrated during "Operation Sun Run," when three new transcontinental speed records were established. The world-wide acclaim of the Voodoo which followed was a fitting tribute to the many McDonnell teammates, engineers and others, who contributed their skills in creating and developing this fine airplane.

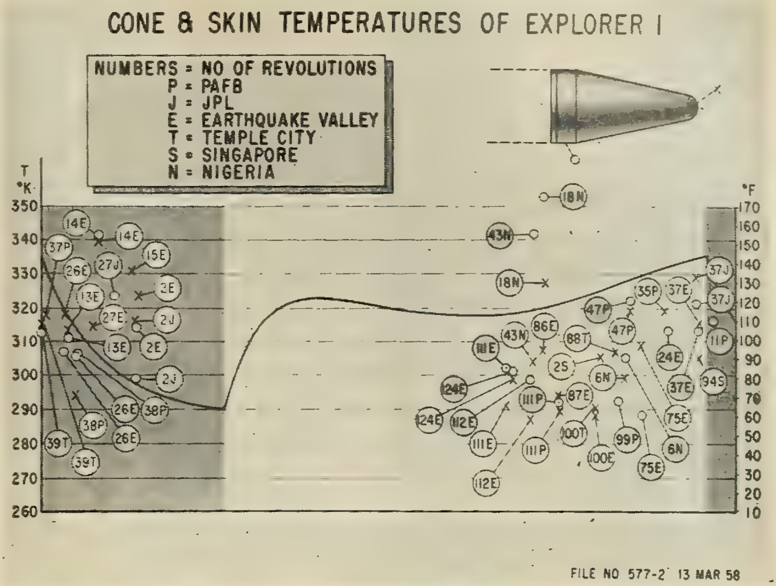
MEN OF

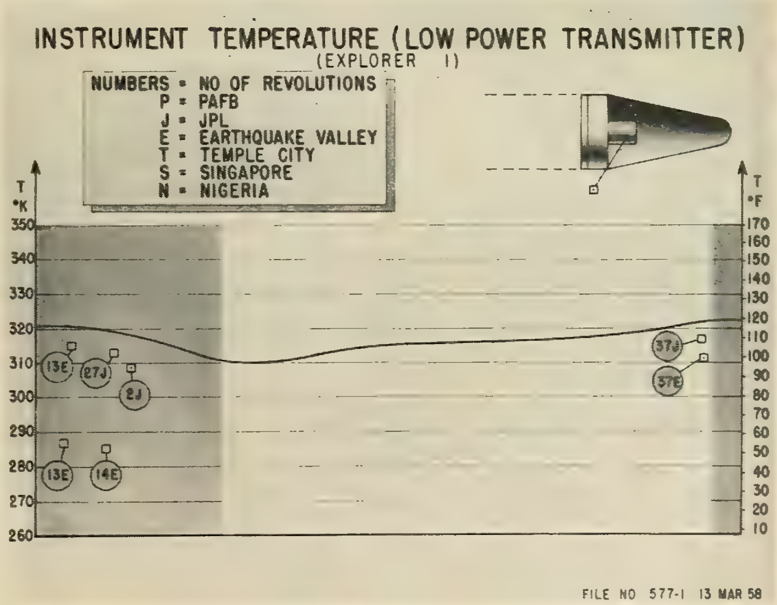
PROJECT F-101

Growth and "opportunity" are usually synonymous. We invite career-minded engineers to compare the growth of the McDonnell engineering organization with any other firm. We will be happy to supply you with a copy of our "Annual Report" for this purpose.

McDONNELL *Aircraft Corporation*

v. Braun Reveals *Explorer* Data





Dallas—At the recent meeting here of the American Rocket Society, Army Ballistic Missile Agency technical director, Dr. Werner von Braun, publicly released for the first time data received from the first U.S. artificial earth satellite—Army's *Explorer I*. Here m/r prints for the first time the plots of temperature readings received from the satellite during its first 124 orbits around the earth.

In the charts above, the continuous line curve represents temperatures as predicted. Shaded areas show where the satellite was in the earth's shadow. The points as plotted show actual measured temperatures. Note that predicted and actual vary considerably from one another. Note also that there are no temperatures which can be considered as excessive in that they would preclude manned space flight. Dr. von Braun said that *Explorer I* has demonstrated that present design (instrumentation, surface coating, etc.) is able to cope with conditions encountered, and that *Explorer I's* readings made it feasible to go head with more ambitious projects.

MACareers Are Successful Careers!

McDONNELL Aircraft Corporation

missile miscellany

This month, this page is going to start with questions: What ever happened to the Chamber of Commerce committee that, just before October 4, urged a sharp cutback in America's defense budget? Why is it the weekly earnings of workers in the aircraft industry jump sharply each December with no comparable increase in the output curve? What's this about Hughes having a new super-successor for Falcon, and about Grand Central Rocket coming out with a shorter, more lethal Sidewinder follow-up? What's the big deal that Allegany Ballistics Laboratory is getting so proprietary about? And why has the Air Force given Aerojet-General a $3.5-million facilities contract to enable them to get into the missile metal machining business—when there's plenty of this capacity around already?

Elsewhere, this page notes that Thiokol Chemical Corp. has a study contract on Minute Man, with implied assurance of follow-up contracts giving them development and production responsibilities . . . Radford Arsenal has bids out for 500 units of the Nike-Hercules booster with the idea of setting up a third source—and you should see the latter-day missile-makers flock to the bait! This page hopes they have some idea of what's involved . . . Tennessee Gas Transmission bought Grand Central Rocket, we hear, in order to diversify into something that would permit it to make more than the seven percent profit to which public utilities are limited . . . Meanwhile Grand Central plans a 50 percent expansion in the next few months; will keep all of its old responsibilities except propellant research which TGT takes over—and another question: Is Grand Central president Bartley going to stay, or has he got something else in mind? . . . And away down south, Army Ballistic Missile Agency has slapped full first priority on earliest possible completion and firing of TV reconnaissance satellite using RCA electronics system . . . Thiokol is reported to have gotten the solid-propellant booster contract from Boeing for Bomarc . . . Rohm & Haas has got the Nike Zeus propellant research program . . . Things seem to be livening up a bit . . . At ABMA crash programs are red-stamped "BLASTS."

AF has slapped a security classification on the new-type accelerometer developed by the Byron-Jackson division of Borg-Warner . . . And from B-W's Ingersoll-Kalamazoo division, word of encouraging progress on a new super-light, high-strength thin-wall casing that requires no machining; and of a revolutionary planetary ground-support vehicle that's amphibious by nature; does away with conventional wheels and troublesome "cat" tracks; and provides a vibration-free stable platform at 70 mph over plowed fields . . .

And AVRO-Canada's "flying saucer" is back in the news again with rumors running rampant, even including that it is powered by magnetic ion propulsion and is flying. Whether this is true or not, that it is on the verge of a major success seems virtually certain—backed by renewed AF interest and money . . . Diversey Engineering is making successful nose caps for Jupiter with a combination of hydrospinning and contour machining . . . This page also hears where pyroceram is being chem-milled.

PROPULSION

Long-range ballistic missiles and space vehicles impose unusually severe demands on the ability of current technology to achieve close tolerances and high performance. Examples of the stringency of these demands are found in auxiliary power supplies and in the monitoring of propellant consumption to obtain minimum burnout weight.

Auxiliary Power Supplies

Several positions are open for graduate engineers with five or more years of experience in rotating machinery development, and an interest in technical management responsibilities, including contractor liaison and test planning.

Propellant Utilization

Opportunities are available in project management of propellant system development for graduate engineers with extensive experience in aircraft or missile design and flight testing.

Inquiries regarding these opportunities are invited.

NEW PRESSURE TRANSDUCER: LOW VIBRATION ERROR AT 2000 CPS, 35G

Combine this with 0.17% resolution and you have truly remarkable performance. What's more, this new Model 717 Absolute Pressure Transducer is *in volume production* in ranges up to 4,000 psia.

Simplicity is the keynote—an entirely new type of Bourdon tube instrument eliminates linkage systems. There is only one moving part in the unit, and static friction is less than resolution. Over-all result: excellent performance during high vibration—static error band of ±0.8% (linearity, hysteresis and repeatability).

New concepts in basic design are being combined with high performance in new Bourns accelerometers, pressure transducers, linear motion potentiometers, and other electro-mechanical devices. When your requirements need the experience of a leader—look to BOURNS.

Outer Space Base?

Navy—Supervised base readied at Point Arguello

Point Arguello—the latest in the galaxy of space names—probably will be this nation's takeoff point into outer space. That's the name the Navy's new Naval Missile Test Facility probably will bear.

Point Arguello NAMTF is coming into being on the 19,000 acres of the Army's old Camp Cooke which has been turned over to the Navy as part of the expansion and development of the Pacific Missile Range. The almost 100,000 acres of California real estate, coupled with the vast tracking facilities of the Navy's Point Mugu Naval Air Missile Test Center, will provide the United States with tremendously expanded facilities for development and testing of missiles and rockets of all services and all ranges.

The West Coast site offers several distinct advantages over the limited capabilities of the Cape Canaveral setup on the East Coast. Primary among these will be the capability of polar or north-south test firings of IRBMs and ICBMs.

Southward of Point Arguello, the nearest land is the Antarctic continent some 10,000 miles away. Habitable and populated areas to the north and south of Canaveral prohibit such tests on the East Coast. There are no space limitations as imposed by Canaveral's 12,000 acres.

Furthermore, the facility, just to the north of the Los Angeles area, places it next door to major missile manufacturers. All these advantages and the already highly developed Navy instrumentation at Point Mugu make the site ideal. The Navy, meanwhile, is planning expansion of the tracking facilities not only for the longer range north-south tests but for testing shorter range missiles on the Pacific range.

- **Canaveral continues**—Although the West Coast site offers many advantages, Cape Canaveral will continue as an important testing base. One distinct advantage the Florida base has is its capability for test firings to the east, taking advantage of the rotation of the earth and getting an object into orbit approximately 1000 mph faster. In any case, as the nation's missile and rocket programs grow, additional testing facilities and ranges are mandatory. Consequently, both the Canaveral range and the Pacific range are highly desirable.

For the immediate present the func-

tion of the Point Arguello facility will be to serve as a missile test and training base for the Navy, and provide facilities for the Pacific Missile Range in support of the Services' joint use of the range. The Air Force rapidly is developing the adjacent Cooke Air Force Base facilities as a missile training base.

- **Details due**—Details of the agreement under which the three services will use the facilities have not been announced. However, it is anticipated that the commander of the Navy's Point Mugu NAMTC, Rear Admiral Jack P. Monroe, will be more than just housekeeper and administrator and will have responsibilities and duties even broader than those exercised by Maj. Gen. Donald Yates of the Air Force at Cape Canaveral.

The complement of the Navy's Point Arguello facility initially will be 3 officers, 16 enlisted personnel and 4 civilians. Upon completion in the early 1960s personnel probably will number more than 1000.

The prospective commanding officer of the new facility is Cdr. Allen Rothenberg, a native of Newark, N.J. who calls Washington, D.C. his home. He was commissioned upon completion of flight training in 1941 and is a highly decorated veteran of World War II. Since July 1956, Cdr. Rothenberg has been deputy for administration to the commander of the Point Mugu NAMTC and the commander of the Pacific Missile Range, RAdm. Monroe.

Plastics Find Greater Use In Rockets and Missiles

Rapidly increasing capabilities to withstand higher temperatures and erosion indicate plastics will play an even more important role in the development of missiles and rockets, those attending the 14th annual National Technical Conference of the Society of Plastic Engineers were told by various industry representatives. Several new plastics also offer distinct advantages in missile tooling and where there is radiation danger.

Among those appearing on the program were Norman B. Miller and Eric L. Strauss of The Martin Company, who discussed the effects of high temperatures and erosion on reinforced plastic laminates. The Martin engineers said that above 250°F reinforced plastics lose strengths slower than aluminum, and that they have improved erosion-resistant characteristics. Conclusion drawn from tests in-

TO PROVIDE **FULL** EDITORIAL COVERAGE

FREQUENTLY AS NEEDED IN A DYNAMIC NEW MARKET

MISSILES AND ROCKETS

WILL BE PUBLISHED

WEEKLY

STARTING **JULY 1958**

America's most successful new business publication, providing technical news and views, features, engineering, electronics, and business information for the $3 billion dollar missile market, has received record-breaking acceptance from more than 21,000 paid subscribers and 411 individual advertisers since it was launched as a monthly in October, 1956.

There'll be many subscribers . . . many more advertisers . . . by next July. Remember, in addition to a major part of the aviation industry, the new missile market is made up of parts of many other industries, the needs of which no other type of magazine can satisfy.

You will reach this market with one magazine . . . MISSILES AND ROCKETS . . . Weekly, starting in July.

Missile Week and Missile Electronics will be incorporated in unusual new frequency formulas.

MISSILES AND ROCKETS

dicate damage in high-velocity air streams during the first 18 seconds is largely on the surface and that phenolic laminates can withstand 300°F for 60 seconds. Further, laminates form a protective burned surface. It also was pointed that while they are more stable, silicones have poorer strength characteristics. Polyester-glass laminates do not perform well at high temperatures, for short time uses and no effective surface coatings have been found, they concluded.

X-15 Production Details Show Space Flight Cost

Recently released information on the Mach 5, 150-mile high North American Aviation X-15 space flight rocket research vehicle provides a glimpse of things to come. Skinned and winged entirely of nickel-chrome stainless steel the manned rocket plane is a 65% welded structure, using both automatic fusion and resistance welding. Its skin side panels are chem-milled.

Other construction techniques on the X-15 include the brazing of all hydraulic connections; the enclosure of lines, controls, wires, plumbing, actuators, etc., in protrusions running down each side of the fuselage; inclusion of extension refrigerated air systems to combat X-15's operational temperature environment which ranges from plus 1,000°F down to minus 300°.

Reaction controls to enable maintenance of altitude in airless space will be hydrogen peroxide powered and include jet reactors in the nose for pitch and yaw control and in the wingtips for roll control. It is expected that X-15 will be flown during 1959.

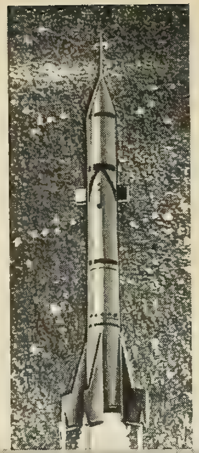
Meanwhile, Pentagon is reviewing 10 proposals for boost-glide rocket bombers and expects to pick three for advanced engineering studies by May 1. Bell Aircraft and Convair are running neck and neck for first place.

USAF Academy Cadets to Study Astronautics

The U.S. Air Force Academy has added a Department of Astronautics to teach the fundamental physics of manned and unmanned space flight.

Through the six-semester-hour course, the Air Force said, it hopes to "develop an appreciation of the engineering and military compromises which must be made in the creation of a new weapon system."

Rocket-powered vehicles, including ballistic missiles, satellites and space vehicles, will be studied to illustrate



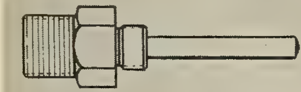
$\frac{\Delta E}{\Delta T} \geq 5$ V FOR 20 F......

ARNOUX
LOX TEMPERATURE PROBES

Semiconductor Series 7XXXL provide output in *volts** for a temperature span of only 20 F in the liquid oxygen (LOX) temperature range—also can be used with liquid nitrogen, liquid argon, and almost any liquified gas from −240 F to −320 F range.

Applications include temperature-stratification measurements (temperature gradients through a LOX tank), sensing liquid levels in tanks, and pipeline measurements during LOX-fueling operations.

*From 0 to 5 vdc, used with Arnoux TME System or similar equipment.



SPECIFICATIONS

Temperature range: −240 F to −320 F
Maximum current rating: 3.0 ma
Nominal resistance: 12,000 ohms at +77 F
Calibration accuracy: 0.1 F
Repeatability and hysteresis: within calibration accuracy
Calibration points: −240 F and −320 F; 1 F increments available between −275 F and −302 F

the design process and how it is influenced by both technological and military considerations. Topics to be covered include stabilization and control of rockets, guidance, atmospheric re-entry, landings on celestial bodies in the absence of an atmosphere, survey of test techniques, and case studies of specific airborne and astronautical weapon systems.

Navigation Achieved for *Polaris* Submarines

The Ship's Inertial Navigation System (SINS), under development for the *Polaris*-equipped submarines, is reported by the Navy to have achieved the necessary degree of navigational accuracy to assure success of the Fleet Ballistic Missile program.

The SINS is similar in principle to inertial navigation systems used in long-range ballistic missile systems. The system provides precise navigation without reference to the stars, radio, radar, or other external methods of navigation. Essentially a computer, it provides the ship's position in latitude and longitude coordinates, true heading or course, surface speed, pitch and roll information—all to a high degree of accuracy, the Navy said.

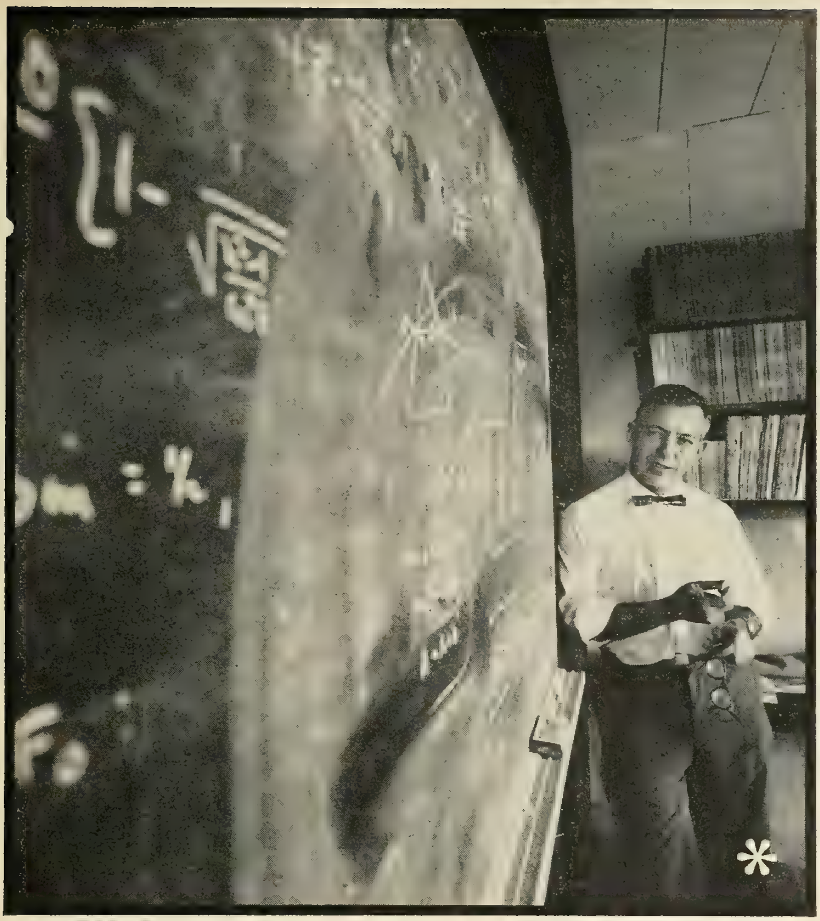
Basic to SINS is its stable gyro platform, or "stable table," which is maintained in alignment with the stars despite the turning and twisting movement of the vessel. The system is susceptible to long-term drift, making occasional reference to celestial fixes necessary. This information is analyzed, decoded and fed back into the system automatically by a Sperry-developed NAVDAC system.

AIA Group Pushes For Central Spec Index

The Aircraft Industries Association's Guided Missile Committee has been pressing the Department of Defense to compile and publish an overall index of specifications applicable to guided missiles, to replace the "incomplete separate service documents now available to guided missile manufacturers," it has been revealed.

The association said a study is now under way to determine the adequacy of guided missile test ranges. Results will be presented to the Department of Defense.

During the past year, AIA disclosed, the number of companies eligible for committee membership has increased 20 percent, because of an increase in the number of member companies who hold prime contracts for complete missiles.



Dr. Eric Clarke, tech/ops vice president, takes a look at a problem in his office at Burlington, Mass.

an oblique look

tech/ops scientists know there are at least three ways of attacking a problem: head on, as an amphibious force hits a beach; flank-wise, as a tactician likes to strike; and *slantwise*, the offbeat way.

This is a basic principle in operations research, the new *team* method of attacking problems, in which *tech/ops* is a leader and pioneer. It is this habit of taking an oblique look—of applying a group of apparently unrelated disciplines to the problem—that has developed, at *tech/ops*, unique solutions in weapons systems, tactics, organizations and logistics.

You may profit by taking an oblique look at your own career problem—and joining a team of *tech/ops* scientists looking for new ways to the future.

personnel requirements at:

Burlington, Massachusetts
Washington, D. C.:

- Mathematical Statistician, PhD, with five years of experience. This position involves research into the sensitivity of stochastic games and the statistical analysis of such games. Candidates must be creative, and possess sufficient skill to develop essentially new mathematics in a relatively unexplored area.
- Mathematician, PhD, with five years of computer experience. This position involves development of sophisticated computer programs for input, output, and simulation of combat operations.
- Also positions for other senior scientists with operations research experience.

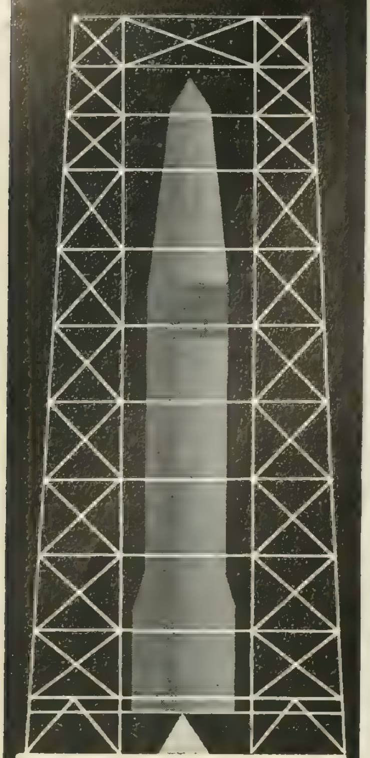
Monterey, California:

- Applied Mathematician, with understanding of application of high speed computers to data analysis.
- Scientist or Engineer with heavy mathematics orientation, to act as project leader of field experimentation group.
- Senior Scientist on PhD level in operations research with background in mathematics and physics.

Fort Monroe, Virginia:

- Logician, with computer knowledge.
- Top-level mathematical economist.
- Electrical Engineer, with background in information or queuing theory.
- Senior Operations Analyst, with training at least on master's level in physical sciences or mathematics and with previous experience in operations research or related fields. Positions involve implementation of CORG research programs in weapons systems, tactics, and organizations.

Please indicate your location preference.



TECHNICAL MANAGEMENT

Ground Support Systems

Technical direction and coordination for the associated hardware contractors engaged in the Air Force Ballistic Missile Program is a major responsibility of Space Technology Laboratories. The scope of this undertaking requires an engineering staff of unusual breadth and competence possessing a high degree of technical management skill.

Several positions are now available for graduate engineers with recent experience in the design, development or testing of missile ground support systems.

Inquiries regarding these opportunities are invited.

SPACE TECHNOLOGY LABORATORIES

Los Angeles 45, California

Airborne Launcher for *Lacrosse*

The development of an airborne control system (ABC) for the *Lacrosse* surface-to-surface missile has been reported by Cornell Aeronautical Laboratory. Also under development is lightweight launching and handling equipment to make the system transportable by helicopter.

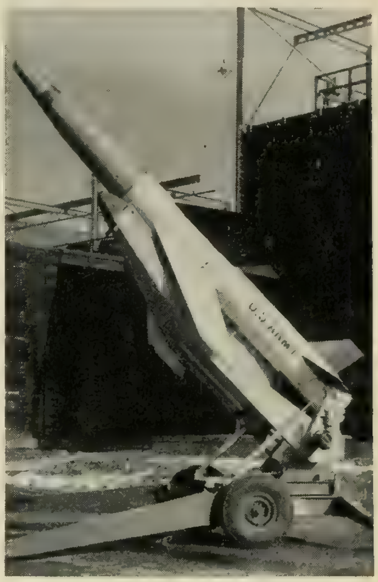
The present *Lacrosse* system, after initial launching from a position to the rear of the combat area, is guided to its target by a forward observer on the battlefield. With airborne control, the missile would be controlled from a position above the battlefield.

Because of its extreme accuracy and high payload, *Lacrosse* makes possible one-shot destruction of such difficult targets as pillboxes. Controlled by a forward observer, the system also can work fast, since it eliminates time taken in transferring target information back to the launching site.

Aerial observation should prove markedly superior in detecting targets, the Laboratory believes. The airborne control program also is particularly suited to the latest concepts of mobility for field armies.

Rapid progress on the ABC project during the past year carried it from study phase into actual flight testing of subsystem assemblies, CAL revealed.

Work on the lightweight launcher also is aimed at improved mobility. According to the laboratory, the specific goal is to make the launcher, as well as other system equipment, transportable by helicopter to strategic points on the battlefield. The present *Lacrosse* uses a launcher mounted on a standard Army truck.



READY FOR ACTION—*Lacrosse* in firing position. The new lightweight launcher is designed specifically for helicopter transportability.

Chrysler Corp. Defends Redstone Cost Figures

Chrysler Corporation has defended its use of "time and materials" subcontracts for the Army's Redstone missile which the General Accounting Office reported to Congress had resulted in "unreasonably high" prices for Redstone parts.

Chrysler said it used that type of contract in the best interest of the missile program until realistic predetermination of cost could be achieved.

GAO had criticized subcontracts totalling 124 million dollars awarded by Chrysler. The price paid was based on estimated labor costs, overhead, profit and material. "Time and materials" subcontracts often are used in early development stages when it is difficult to say how much a part should cost. Such contracts were justified at the start of the Redstone work, GAO said, but later should have been shifted to fixed price contracts.

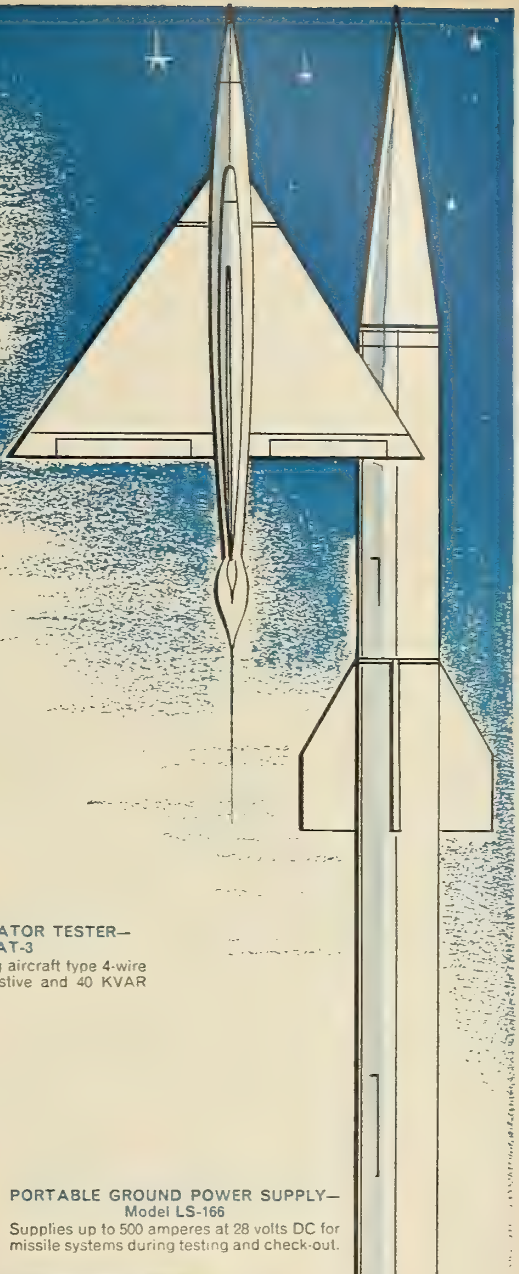
Bomarc Officers Complete First Phase of Training

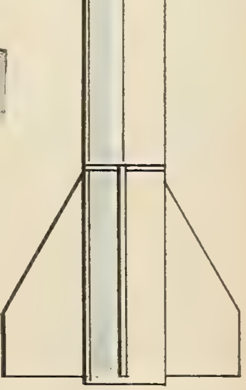
The first group of Air Force officers to receive training on the *Bomarc* missile have completed the first round of technical instruction in operational use of the Mach 2.5 surface-to-air missile.

The officers, selected for this five-month maintenance engineering seminar, are attached to the recently formed 4751st Air Defense Missile Wing, 73rd Air Division, Tyndall Air Force Base, Fla. The officers have received their training at a special Boeing Airplane Co. school in Seattle.

These missile wing officers are being given actual "on the job" assignments in Boeing's Pilotless Aircraft Division for several months. Following this, their training will carry them to the *Bomarc* test firing unit at Cape Canaveral, Fla., and then to the *Bomarc* operational testing base.

SPACE AGE TEST EQUIPMENT

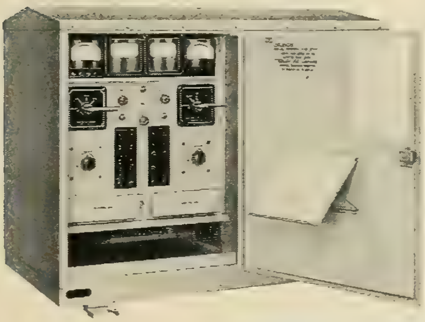




The age of super-sonic flight and space travel imposes new and more exacting demands upon testing and ground support equipment.

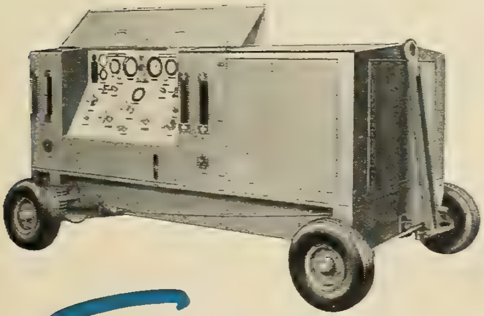
SUN is recognized as a leader in the development, design and production of testing and support equipment for aircraft, missiles, and "in-plant" testing applications. Hydraulic, pneumatic, electrical and electronic testing equipment—all come within the scope of SUN's fine engineering and production capabilities.

Write today for your free copy of SUN's new catalog of Test and Support Equipment.



AIRCRAFT ALTERNATOR TESTER—
Model AAT-3
Designed for load testing aircraft type 4-wire alternators. 60 KW Resistive and 40 KVAR Reactive Load capacity.

AIRCRAFT HYDRAULIC SYSTEMS TESTER—
Model AHT-35
For testing hydraulic systems employing high temperature fluids. Gasoline engine or electric motor driven.



PORTABLE GROUND POWER SUPPLY—
Model LS-166
Supplies up to 500 amperes at 28 volts DC for missile systems during testing and check-out.

Conservative White House Report On Space Flight Objectives

Proposed legislation designed to assure civilian agency control of outer space programs was due to go to Capitol Hill from the White House as m/r went to press.

Indications at press-time were that the proposal would define the place of the National Advisory Committee for Aeronautics in an outer space research program. Best guess was that a new agency using NACA personnel and laboratories as a nucleus would be recommended.

At the same time, a report by the President's Science Advisory Committee entitled an "Introduction to Outer Space", was made public with President Eisenhower's blessing. The report, in conservative, non-technical terms, defines both the interest of civilians and of the military in outer space, laying emphasis on the importance of space exploration in solving problems of communications and meteorology.

There was a tendency, in the report and the President's comments, under present conditions, to down-grade the value of space vehicles as weapons carriers. The committee said "In short, the earth would appear to be, after all, the best weapon carrier."

A timetable of scientific objectives stated only in terms of early, later and "still later" time scales is included with the explanation that specific timing will depend on the level of effort—that space research must not foreclose the continuation of research of a more prosaic and earthly type.

The committee, in concluding the report said: "it would not be in the national interest to exploit space science at the cost of weakening our efforts in other scientific endeavors. This need not happen if we plan our national program for space science and technology as a part of a balanced national effort in all science and technology."

As for the current effort, the committee warned that rocketry and other equipment used in space technology must usually be employed at the very limit of its capacity. This means failures of equipment and uncertainties of schedules are to be expected. "It therefore appears wise to be cautious and modest in our predictions and pronouncements about future space activities—and quietly bold in our execution," the report stated.

1st National Missile Meet Set June 4-6 at Washington

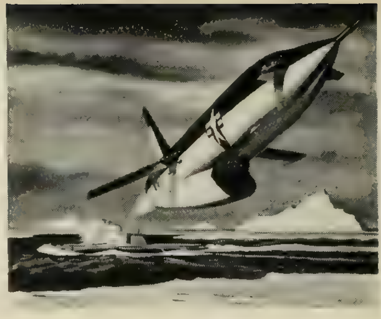
The National Rocket Club of Washington, D. C., has announced that the First National Missile Industry Conference will be held on June 4 and 6 at the Mayflower Hotel. The Aircraft Industries Association and the National Capital Section of the American Rocket Society have been invited to participate.

The NRC, which started as an informal monthly luncheon club, is a non-profit organization. Among its members are men from the Department of Defense, the three military services, the House of Representatives, the Senate, the rocket and missile industry and the press. Objective is promoting advancement of U.S. missile and astronautics programs.

Purpose of the First National Missile Industry Conference is to enable missile businessmen to get together with the experts and discuss their mutual problems. Meetings for the three-day session will be in the form of panel discussions, and topics discussed will be sales, procurement, subcontracting and business forecasting—all in the missile, rocket and space flight field. Participants in the panels will represent Congress, the Department of Defense, industry and the press.

Highlighting the conference will be the Dr. Robert H. Goddard Memorial Dinner, to be held on Friday, June 6, when various awards will be presented for outstanding contributions to the missile industry. One of these will be given by Wayne W. Parrish, President, American Aviation Publications, Inc.

Two leading missile manufacturers also will present awards. Proceeds of the dinner will be turned over to the Dr. Robert H. Goddard Fund of the Guggenheim Foundation. Thomas Wilcox, Rocket Club Executive Secretary, 1013 Woodward Bldg., Washington 5, D.C., is coordinating conference activities.



KEY ENGINEERING
OPENINGS
AT VOUGHT

PROPULSION Vought is studying a number of advanced propulsion systems. They include nuclear, solid and liquid fueled rocket components. They involve intensive investigations into internal aerodynamics, heat transfer and other problems.

Additional skilled theoreticians and engineers are needed to advance these studies. For a few men whose skills have been highly developed — academically, or on the job — these openings offer pioneering experiences with an outstanding weapon systems management team. Requirements follow for 4 of these posts:

Aero or Thermo Specialist. Aeronautical or Mechanical Engineer with advanced degree plus at least 7 years in propulsion system design, specializing in internal aerodynamics and heat transfer. Special consideration for Mach 4 and above flow study experience. To lead complete studies in this specialty as applied to new propulsion systems.

Lead Propulsion Engineer. Aeronautical or Mechanical Engineer with advanced degree, plus 1 to 4 years experience in nuclear, solid and liquid rocket, or ramjet design. To develop new propulsion systems using nuclear and/or rocket fuel components (solid and liquid). To carry design through preliminary stages and possibly assist project phases.

Staff Engineer, Nuclear Propulsion. Aeronautical or Mechanical Engineer, or Physicist with M.S., plus 10 years experience in propulsion system design, including 5 in nuclear development. Should be equipped to perform all technical design work in connection with nuclear propulsion systems.

Propellant Analyst. Chemical Engineer with M.S. (preferred) or B.S., plus 5 years experience in solid and/or liquid fuel studies. To develop propellants for unique power systems.

To arrange for a personal interview, or for a prompt report on these or other current openings, return coupon to:

City____________State________

Vought Vocabulary

in′ge·nu′i·ty: *designing a 12-ton missile to fit inside an atomic sub*

Chance Vought's *Regulus II* missile is twice as long as a city bus. It is crammed with delicate instruments, armed with a nuclear warhead. Yet Vought engineers designed *Regulus II* to serve safely, efficiently aboard the Navy's newest nuclear-driven submarines.

They shock-proofed the missile against underwater blasts. They conditioned it for polar ice, or equatorial heat. They made it — like Vought's smaller Fleet veteran, *Regulus I* — a dependable weapon, accurate from conventional or nuclear subs, from surface ships or highly maneuverable, mobile shore launchers.

Aboard its special, globe-girdling sub, *Regulus II* will move *invisibly* any distance to its launching point. There it can begin a supersonic, long-range strike in minutes. Or it may lurk unseen for months as a patient and ready deterrent.

A chilling prospect for would-be aggressors, this example of Vought ingenuity.

Scientists and engineers: pioneer with Vought in new missile, manned aircraft, and electronics programs. For details on select openings write to: C. A. Besio, Supervisor, Engineering Personnel, Dept. P-2.

Miller, Fossen Join m/r Editorial Staff

William O. Miller has joined m/r as associate editor for military and legislative affairs. He formerly headed the radio and television branch of the office of the Chief of Information, U.S. Navy. From 1945 to 1950 he was assistant to the editor of the ATLANTA CONSTITUTION, a staffer in the Atlanta Bureau of the Associated Press and editor and publisher of his own weekly newspaper in Hampton, S.C.

Peer Fossen associate editor, optics and telemetry, comes to m/r from Page Communications Engineers, Inc., Washington, D.C. where he was editor-writer in the publications division. Prior to joining PCE he was associated with Army and Air Force technical publications.

m/r Columnist Receives USAF Civilian Award

Dr. Hubertus Strughold, dean of space medicine and m/r columnist received the Air Force's Exceptional Civilian Service Award during the recent Jet Age Conference in Washington, D.C.

Presentation of the plaque was made by Gen. Thomas D. White, USAF Chief of Staff at the conference banquet.

Advisor for Research to the Commandant of the Air University's School of Aviation Medicine, Dr. Strughold was cited for his "contributions to the complex problems of man's existence in space."

The space medicine expert organized the school's Department of Space Medicine in 1949, two years after his emigration from Germany.

Dr. Castruccio Named To m/r Advisory Board

Dr. Peter A. Castruccio, 32, advisory engineer at the Westinghouse Missile Subsystems Engineering Department, has been named to the m/r Editorial Advisory Board.

Dr. Castruccio, holder of several radar patents with numerous patents pending, is currently engaged in advanced planning of interplanetary electronics communications and navigational aids of the future. He formerly held positions with Bendix Radio and The Martin Co. in the field of military electronics.

The young scientist has written many papers and articles for technical magazines, including m/r. He majored in physics at the University of Sao Paulo, Brazil and won his doctorate summa cum laude in electrical engineering at the University of Genoa, Italy, at the age of 21.

Safety Device Developed for Handling Explosives

A newly developed safety device is giving added protection to research chemists handling hazardous compounds in the search for more powerful propellants.

Designed by Henry Rolewicz of the Redstone Arsenal Research Division of Rohm & Haas Co., the device is a portable shield consisting of three concentric baskets of perforated 1/8-inch sheet aluminum. The ¼-inch perforations are staggered on ½-inch centers to eliminate the possibility of direct passage from the interior. Tests, using up to five grams of "Composition C," have shown the shield will effectively stop all fragments while the perforations permit venting of the shock wave.

The device is most useful in transporting reactors or product receivers from test areas.

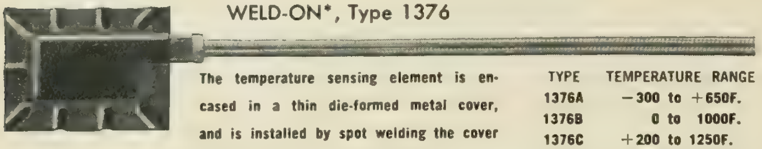
CEMENT-ON*, Type 1375

The temperature sensing element is encased by a die-formed wire screen which can be installed on any surface with TRANS-SONICS Type 64C cement.

TYPE	TEMPERATURE RANGE
1375A	−300 to +650F.
1375B	0 to 1000F.
1375C	+200 to 1250F.
1375D	+500 to 1550F.

actual size



WELD-ON*, Type 1376

The temperature sensing element is encased in a thin die-formed metal cover, and is installed by spot welding the cover to the underlying metallic surface.

TYPE	TEMPERATURE RANGE
1376A	−300 to +650F.
1376B	0 to 1000F.
1376C	+200 to 1250F.
1376D	+500 to 1550F.

- **RANGES:** From −400F to +1550F.
- **OUTPUT:** Up to 5 volts without amplification.
- **RESISTANCE CHANGE:** 100 ohms over calibrated range.
- **ACCURACY OF CALIBRATION:** ±1% of range interval
  ±2% for temperatures over 1000F.
- **MAXIMUM CONTINUOUS CURRENT:** 20 milliamperes rms.
- **REPEATABILITY:** ±0.2% of range interval.
- **VIBRATION:** 1-inch double amplitude, 0-22 cps;
  25g, 22-2000 cps.
- **ACCELERATION & SHOCK:** 100g on all three major axes.
- **LEADS:** Two 6" nickel wires with high temperature insulation.

Trans-Sonics Cement-On Type 1375 and Weld-On Type 1376 Surface Temperature Transducers are platinum resistance thermometers that can be installed on any surface, flat or curved, metallic or non-metallic, for accurate temperature measurement. The protective cover of the resistive element is cemented or welded directly to the thermal surface to form an isothermal system which gives a transducer reading that corresponds to the true skin temperature.

A 5 point resistance-temperature calibration certificate at 0, ¼, ½, ¾ and full scale temperature is supplied with each transducer. A strip of aluminum Thermotape* is also furnished with each unit to provide an alternate means of tape-on installation useful to 800F and under limited conditions to 1000F.

Types 1375 and 1376 are the newest members of the Trans-Sonics family of platinum resistance thermometers for measuring surface temperatures. All units are capable of delivering up to 5 volts without amplification. Write to Trans-Sonics, Inc., Dept. 9, Burlington, Mass. for Technical Bulletin on Surface Temperature Transducers.

Space Age Conference a Hit in Los Angeles

The Los Angeles Chamber of Commerce struck pay dirt in a big way when it decided to put on a missile show last month.

The 1958 Western Space Age Conference and Exhibit was held March 20 to 22 at the Los Angeles Shrine Exposition Hall. Its theme: The U.S. Missile Market.

Planned by the chamber's industrial market development committee as a possible means of opening the gates to missile profits for the numerous small-size companies, which had been hard hit in the aircraft cutbacks, space for 200 exhibits was mapped out.

These were sold out within hours and another 150 spaces had to be added to meet the demand. When reservations poured in for two $8 luncheons and one $10 dinner (Dr. Wernher von Braun spoke on "The Space Age Time Table" at the latter), arrangements had to be made to accommodate 2000 instead of the originally anticipated 500 or 600.

"It turned out to be one of the most ambitious undertakings ever attempted by the chamber of commerce," said Kenneth F. Julin, president and general manager of Leach Corp. and chairman of the industrial market development committee.

Essentially, the purpose of the event was to bring the buyer and the seller together. About 50 prime contractors had exhibits. Show-stoppers included first public showing of the Douglas Aircraft Co.'s 40′ x 40′ working model of a *Thor* launching site and a scale model of the first U.S. satellite, the *Explorer,* by the Army and the Jet Propulsion Laboratory.

The two-day conference program, held in conjunction with the three-day exhibit, was arranged so that the first day was devoted to the business aspects of the U.S. missile market, with a keynote address by Dr. Lee DuBridge, president of Cal Tech, followed by addresses by Lt. Gen. Clarence S. Irvine, Air Force Deputy Chief of Staff for Materiel; Rear Adm. Jack P. Monroe, commander of the Naval Air Missile Test Center, Point Mugu; Vincent de P. Goubeau, vice president-materials, RCA, and Donald W. Douglas, Jr., president of Douglas Aircraft Co.

Technical sessions were held the second day with panels on such topics as quality control in missile production, metals and missiles, and tooling for missiles.

Emphasis on Flexibility Seen as Key to AF Missile Maintenance

Air Force's experience with an operational missile system in Europe (Matador) has helped to answer a couple of vital questions in respect to missile maintenance.

Chief concern of the policy makers has been whether the special requirements of missiles would necessitate major changes in the present aircraft maintenance organization. There was also the possibility that two separate systems would be required during the few years that manned aircraft will continue to play a prominent offense/defense role in the Air Force.

Two separate systems would be prohibitively expensive and cumbersome, while the entire maintenance organization would result in a long period of transition and a low level of efficiency for possibly several years.

Some surprising facts have emerged from this brief experience with operational missiles. Similarities between aircraft and missiles, in respect to maintenance problems, have tended to simplify the overall picture. In fact, Pentagon officials feel that the transition from manned aircraft to missile maintenance will be no more difficult than adapting the system to improvements in aircraft through the last few years.

One thing is certain, officials point out, and that is that the present system will be considerably streamlined out of necessity, and the overall maintenance organization will be much improved as a result.

Although the basic structure of the organization will remain the same, some minor changes have already been made, and more of them are already in the mill.

- **Retraining is problem**—The major problem in changing weapon systems is that of retraining technicians and specialists. It is here that ground is lost, and efficiency is sacrificed during the changeover.

However, it is also here that Pentagon officials are most enthusiastic. In clarification of this point an official told m/r that at the depot level all areas of missile maintenance can be taken pretty much in stride. As examples he cited sheet-metal work, engine overhaul, and electronics troubleshooting and repair.

Metalworkers experienced on aircraft will encounter no real problems in the same area of missile maintenance. Engines are pretty much the same as those used on high-performance aircraft, it was pointed out, so again no real problem of retraining. Electronics equipment on modern aircraft is as complex and sophisticated as missile guidance systems. As these major areas are eliminated; airframe, engines, electronic gear; the problem resolves itself to one of lower echelon significance.

In this lower echelon of maintenance, the squadron level, the changes taking place are reshaping the overall maintenance organization. But, there is nothing happening here that the Air Force has not had experience in.

Retraining of "flight-line" personnel is something that must be done even in respect to old-type aircraft. The personnel at this level range from people who are new to the service to careerists, and most of the training in either case is for jobs that are performed on or near the flight line. "What difference," one official said, "whether the training is on aircraft or missile; its something we have to allow for."

- **New patterns**—Implementation of missiles as operational weapons has resulted in two new patterns at the squadron and group level, both designed to furnish the important aspects of flexibility and speed.

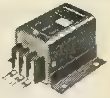
In the case of *Atlas* there is the combined-squadron, the maintenance and missile launching teams both within the same squadron organization. The same organizational structure is planned for *Bomarc*. There is a possibility that this type organization will be designated a ballistic missile unit.

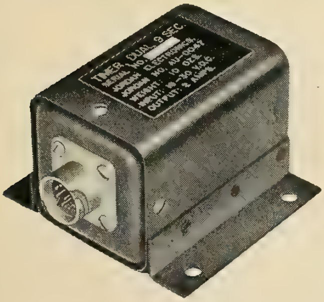
The units now operational with *Matador* missiles are group level, with a TAC Squadron concerned directly with launching missiles, and maintained by a separate Maintenance Support Squadron. Maintenance squadrons are concerned with Receiving, Inspection and Maintenance (RIM), and Assembly and Maintenance (A&M).

Flexibility is built into the new units in that if the need arises for greater capability from any unit it can be expanded from a single-squadron unit to the group unit, and in the case of a group more TAC squadrons can be added, supported by the same maintenance squadron, and thereby doubling the firepower of a group without changing its basic organizational structure.

Alert teams from the A&M sections can be called to the flight line to make quick changes of control boxes, components or even engines, to keep alerted missiles in a state of readiness. Components removed from flight-line

TIME DELAY RELAYS
The extensive time delay relay line includes delayed pull-in and delayed drop-out with a wide range of time intervals and pulse types.





NEW TRANSISTOR CIRCUITRY
developed by JORDAN ELECTRONICS provides the RELIABILITY OF PERFORMANCE demanded by today's missiles and aircraft.

NEW TRANSISTOR CIRCUITRY
makes possible a smaller, lighter-weight unit that can tolerate the extreme environmental conditions of today's missiles and aircraft.

FLASHERS AND KEYERS
This new maintenance-free transistor circuitry eliminates the need for rotating machinery and thermal elements.

As small as 0.8 cu. in. our lighter-weight miniature design is adaptable to any mounting. requirement.

TIMERS
This new circuitry and patented design permit a wide range of time intervals from 50 milliseconds to several hours.

weapons are repaired in A&M's shops, at the depots, or if all these fail, by the prime contractor.

The byword in missile maintenance has been described as, capability of maintenance as close to the missile site as possible, with rapid and reliable flow of serviceable parts.

Ehricke Predicts Space Flight Timetable

Krafft A. Ehricke, assistant to the technical director of Convair Astronautics, said recently that progress in the current development program of the Atomic Energy Commission will provide practical powerplants for use in 1965-70.

Ehricke presented preliminary designs for a 200-foot, 90-ton, two-stage chemonuclear vehicle that he said would be capable of landing a 22,000-pound payload on the moon or orbiting a 30,000-pound payload around the planet Mars. Carrying a 15,000-pound payload, this vehicle could land a scientific expedition on the moon, with enough fuel remaining to take off, return to the edge of the earth's atmosphere and transfer personnel to a reentry glider.

Ehricke's first stage is a delta-wing glider of 90-foot span, powered with conventional gasoline and liquid oxygen rockets developing 2.7 million pounds of thrust. It would return to earth after boosting the manned second stage beyond the earth's atmosphere.

Power for the second stage is provided by feeding liquid hydrogen to a rocket engine that has a nuclear pile as its energy source. Thrust is obtained by expelling a jet stream of hydrogen atoms from a rocket exhaust nozzle.

Ehricke presented the following timetable for lunar rocket developments, contingent on a concerted national effort:

Phase I, 1958-60—Shooting a rocket close to the moon, then impacting on the surface, circumnavigating the moon, establishing a satellite around it, and making a controlled landing.

Phase II, 1964-66—Landing instrumented vehicles on the moon; sending out manned rockets for lunar reconnaissance; and, in the period 1967-70, landing small scouting parties.

On the basis of findings in this phase, a decision will have to be made whether it is worthwhile to undertake building a permanent moon base, he said. If so, this would lead to:

Phase III, early 1970s—Building a supply system to establish and maintain permanent lunar bases.

for tomorrow's space weapons systems...

Electronic Ground Support Equipment

Link's vast experience in the fields of electronics, computers, simulators and associated systems is now being concentrated on the urgent needs of missile ground support equipment.

Unmatched experience, highly specialized engineers, and modern facilities qualify Link to take on the most demanding assignments. Together, they help bring about original solutions to the unorthodox projects of today. Imaginative engineering has been a Link attribute for a generation.

Link know-how has already resulted in major projects, delivered hardware:

- Computers
- Simulators
- Optical Systems
- Missile Training Equipment
- Component Assemblies
- Go-No-Go Test Equipment

In these areas, in other missile ground support systems, Link electronics can provide the answer.

For a comprehensive brochure on Link's engineering and production facilities, write to:

54PB67-T2
with 52PA5 Button

The "50" series switch, shown at left, is a two position, alternate-action switch. The two level visual indication allows extra flexibility in complex control panels. The position of the button—up or down—indicates the condition of the circuit. An independent indicator lamp is free to give additional information, or it can be wired to go "on" and "off" with the switch.

The "50" series switch, at right, is a unique magnetically held pushbutton. This extremely versatile switch combines multi-circuit switching, indicator light and d-c holding solenoid in one compact unit. When the button is pushed, the switch contacts are held actuated until electrically released. This permits one-by-one "bailing" operation with remote electrical release, allowing complete freedom of panel layout.

These switches are available with two, three or four SPDT contact structures. All lamp and button options may be used. They are rated at 5 amps., 125-250 vac. 3 amps., 30 vdc.

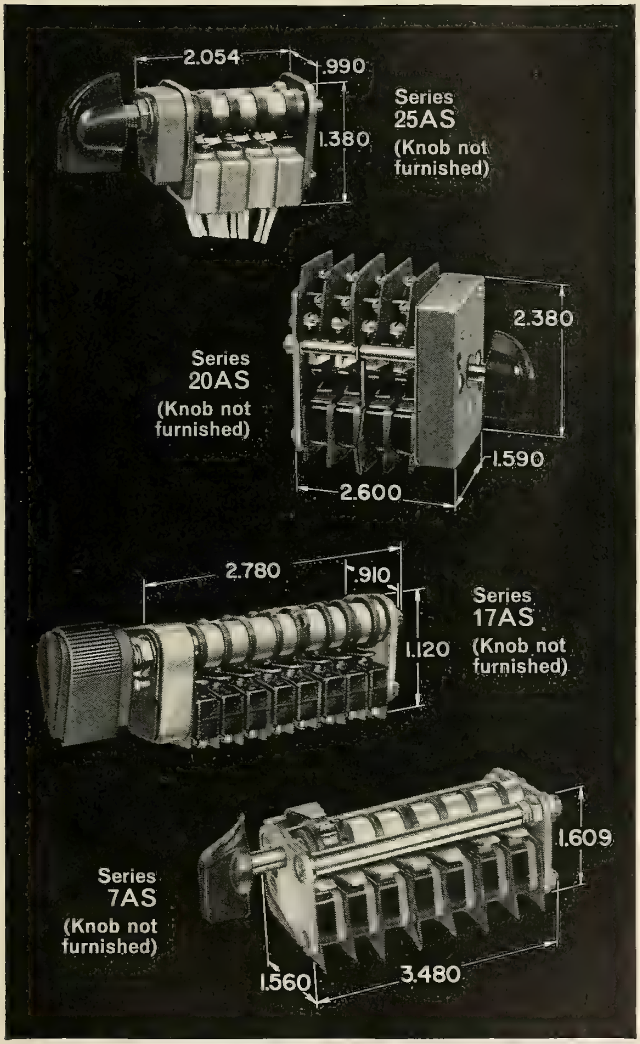
SWITCH Precision Switches and Aircraft Instrument Panels



Smallest Rotary Selector Switch Assemblies Available . . . Provide up to 20 Switching Units.

"25AS" series rotary selector switch assemblies are the smallest available with environment-proof sealed subminiature basic switching units. Assemblies are available with from two to eight SPDT sealed subminiature switches. Optional positive detent positions from 2 to 8. Rated 5 amps., 125-250 vac. 3 amps., 28 vdc.

"20AS" series rotary selector switch assemblies are extremely versatile. Available with 4 to 20 "V3" type switching units. They are compact, sturdily constructed, and highly reliable. Panel sealing and detent positions are optional. Rated 10 amps., 125-250 vac. 10 amps., 30 vdc.

"17AS" series rotary selector switches are small compact assemblies, available with up to ten SPDT subminiature basic switches. 45 degree angle detents are available in 2 to 8 positions. The use of these assemblies reduces instrument panel space. Rated 5 amps., 125-250 vac. 2½ amps., 30 vdc.

"7AS" series rotary selector switches are compact and sturdy assemblies of two to eight SPDT "V3" type switches, ideal for applications requiring multi-circuit control of 10 amp. circuits. Available in 2 to 8 detent positions. Rated 10 amps., 125-250 vac. 10 amps., 30 vdc.

For complete details on these assemblies ask for Data Sheet 86a.

The two-word name "MICRO SWITCH" is NOT a generic term. It is the name of a division of Minneapolis-Honeywell Regulator Company.

Many unknowns make one answer clear:

Man on the Moon?—Probes Due First

by Frederick I. Ordway, III,*
Ronald C. Wakeford

THIS YEAR man is accumulating scientific information in the general region of one earth radius out into space. He is actively planning to extend the altitude of both research rockets and artifical satellites to several earth radii.

Preliminary attempts may be made this year to impact a rocket on the lunar surface, or to effect a circumlunar trajectory by an instrumented probe. Within six to eight years it may be possible to bring the payload section of such a rocket back to earth, and, perhaps by 1968, we may be able to land a probe on the moon, monitor its takeoff, and guide it back to earth. By 1975 or earlier, it seems reasonable to expect that man himself will be on the moon.

• **Old travel plans**—Serious proposals for moon travel date from the time Tsiolkovski (1895), Oberth, Goddard and other pioneer astronautical scientists began to write on rockets, satellites and space travel.

In a 1930 lecture, France's Esnault-Pelterie could accurately say that the moon journey must be carefully planned and that it would be a rigid, exact matter. He knew that the ship would "start off slowly, so that while we are passing through the atmosphere our speed is increasing as rapidly as possible."

He figured that the top velocity would be reached after "eight minutes of travel, when we are 1200 miles above the earth." This French pioneer was cognizant of space medical problems, suggesting a maximum acceleration of three g's, distributed over the human body in the prone position.

Many of the early moon proposals were based on direct flight from the earth to the moon, while others sought to take advantage of earth-orbiting space stations, from which rockets would ascend to the lunar objective.

• **Newer proposals**—Modern proposals include both techniques, but often assume neither a lunar landing or return to the earth. The following plans are suggested: takeoff from earth's surface; takeoff from balloon platform in outer atmosphere of earth; takeoff from earth-satellite station from 200 to 1000 miles above surface.

A number of flight plans appear possible which might result in any of the following: probe space at lunar orbital distances; impact on the moon; circumnavigate the moon; establish vehicle in orbit around the moon; land instruments on the moon.

Finally it will be eventually desirable to return the moon vehicle to the earth, or at least to the vicinity of the earth. In the latter case we might develop a probe that would circumnavigate the moon, and then return on the leg of a trajectory passing close enough to the earth to enable interrogation of the instrumentation from a surface station.

If this probe could be pro-

**General Astronautics Corp.*

...Man on Moon?—Probes Come First

grammed to return to the earth's atmosphere, braking and parachute descent techniques could be employed to retrieve the instrumented section. The ultimate stage will arrive when man can fly to the moon, land, take off and return to a terrestrial base with a comfortable supply of fuel and other supplies in reserve.

• **Around the moon**—Krafft Ehricke and others have, in recent years, prepared numerous studies covering important aspects of lunar flight. In one paper, Ehricke and George Gamow have worked out many flight details of a circumlunar rocket, which they postulated would weigh 240,000 pounds and would have a 400-to-800-pound payload capability. Such a vehicle's velocity at the circumlunar end of the trajectory would be quite low, so that much information could be recorded by the instruments.

Of the total trip time of 157 hours, 50 would be under conditions permitting close observation of the moon. Closeup images might be sent to the earth by facsimile transmission techniques. Television recordings could be made on tape and played back when the probe returns to the earth's vicinity.

The term cislunar space has been introduced by Ehricke, to define the general region between the earth and moon where neither body dominates the rocket's path exclusively. This general region of space is significant to artificial satellite mechanics and as terminal points of returning vehicles.

Somewhere between 10 and 25 earth radii, a "flat minimum" exists where perturbations due to terrestrial oblateness and to the moon are small. At 125,000-150,000 miles out, the moon begins to become a strong perturbing force.

• **Navigation problems**—Many studies of the moon voyage have been based on simplified two-body calculations (earth and moon alone considered). But it is known that, once a rocket has moved out 4000 or more miles from the earth, both the moon *and* the sun commence to affect the flight path, and orbital calculations become very complicated.

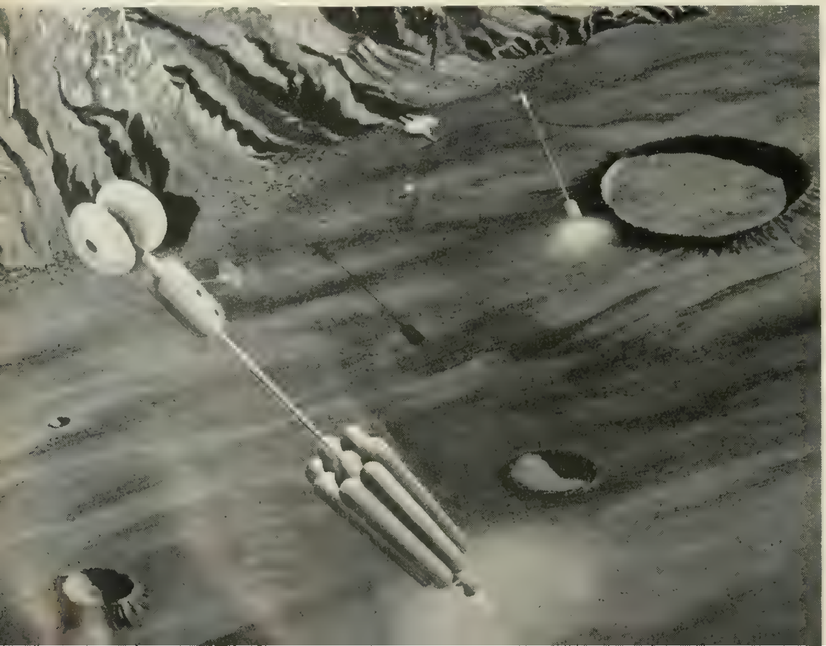
When the sun is introduced as a perturbing agent, complex three-body situations exist which may eventually have to be handled by onboard electronic computers. Internal navigation would permit orbital corrections along the flight path. Depending on initial flight conditions, the rocket would hit the moon, or circumnavigate it and return to earth space, or swing around it and escape.

An earth-moon trajectory is complex. As an example, H. Lieske shows that to hit the moon, the accuracy of the velocity vector would be 100 ft/sec. In pointing angle, one degree would be necessary. Now, if it is desired to pass very close to the lunar surface and return to the earth's atmosphere at, say 50,000 feet, it is shown that at least one foot per second value would obtain for the magnitude of the velocity vector, and up to 1/1000th of a degree in pointing angle.

Aeronutronics Systems, Inc., has recently been involved in studies of impacting on the moon. The company has conceived of a technique that would utilize a light, compact optical system in the rocket to determine its distance out from the moon in terms of the size of the moon's image. By transmitting the resulting information over a data link, scientists would in effect obtain a view of the moon approach by an optical-to-electronic picture conversion scheme.

PROBES will explore, before men set foot on Moon's surface.

Convair



In preparing for the lunar voyage, the flight program will consist of three elements: the powered phase, coasting (unpowered) and landing. *Far Side*, *Explorer*, and *Sputnik* tests have provided useful experience for the initial phase, but as yet no significant experimental data has been accumulated on rocket landing maneuvers and what would be involved in them.

• **Moon satellite**—Earlier we mentioned the possibility of establishing a satellite around the moon. Rand Corp.'s R. W. Buchheim and others have treated the problem in some detail, and it seems logical to assume at least one such vehicle will be constructed prior to attempting manned lunar flight.

Buchheim shows that a lunar satellite in an eight-hour orbit would move relative to the moon at about the same speed as the moon moves in relation to the earth—that is, at about 3360 ft/sec. Thus, if the lunar satellite had a period greater than eight hours, it would constantly move relative to the earth in the same direction as the moon. If the period were under eight hours, it would move sometimes in the moon's direction and sometimes opposite to it. At 5000 miles out, it would have a period of just 24 hours. (In making these flight-path calculations, the sun, the earth's oblateness, and other perturbing agents were neglected.)

Establishment of a lunar satellite would serve a number of purposes: as a takeoff point for the descent of an instrumented probe to the moon's surface, as a communications relay point, as a tool to determine the shape of the moon, and as "lunar-physical" research device.

Ehricke has suggested that it might be fitted to detect a possible residual lunar atmosphere. It would seem possible to prepare a lunar version of the NACA sphere experiment designed for a *Vanguard* test; such a sphere would be released and observations of its motion in orbit might reveal the existence of a tenuous atmosphere.

• **Controlled landing**—Once man is able to effect a controlled landing of an instrumented probe on the moon he will have made significant progress toward getting himself there.

Probably the first item to be landed would be suitable radio transmitting equipment. Later a variety of devices designed to study lunar characteristics would be expected, such as seismographic equipment, temperature-sensing equipment and, of course, the necessary power supplies.

In considering manned moon travel, all the space medical problems applicable to manned satellite and space flight will apply: zero gravity, cosmic radiation, acceleration, temperature, nutrition, artificial cabin atmosphere, waste removal, and, in general, the overall situation of life in a completely closed environment.

There are two general schools of thought among human factors specialists, concerning the role of man in lunar and circumlunar flight.

Some feel that the man must be alert during the entire flight, to observe, repair broken instrumentation and make any of a variety of emergency decisions.

Others would be content to leave man on the earth and allow instrumented probes to perform all the scientific observations, or at most, put the crew in a dormant state during the major portion of the voyage. They would be fed intravenously and sensing devices in the cabin would detect ambient conditions and order necessary corrections in atmospheric content, temperature, etc.

• **Man to the moon**—In a modern interceptor, armed with complex guided missiles, man is integrated into the overall guidance and control system. Often the greater part of his mission is monitored from ground-control stations, from the moment he enters into a zone of active defense or offense to the time he returns to base. His decision-making abilities are reserved only for emergencies and unusual situations.

A similar condition may prevail on early manned lunar flight, with the pilot being called upon only to make emergency decisions.

It is likely that all early navigation will be performed from astronomical observations on the earth and that corrections will be made by radio transmission.

The concept of communications between a moon rocket and the earth has received a considerable amount of study, and does not appear to offer insoluble problems.

• **AF moon rockets**—In February 1957 the Air Force Office of Scientific Research and Convair sponsored an astronautics symposium where it was emphasized that USAF already was working on a moon rocket project. Moon flight studies were reported underway at such organizations as Douglas and Convair, and the Rand Corp. continued to study the problems of circumlunar flight and moon landings for the Air Force. Convair reported that it had worked out a program to place 200 pounds of camera, television and tape recorder equipment around the moon.

Rand Corp. is concerned with tracking and communications problems as they relate to a moon vehicle. The particular vehicle under consideration would impact the moon, then telemeter data to earth stations at a relatively low rate (desirable because the things we are interested in learning about the moon's surface do not occur at rapid rates; and high transmission rates are not easily come by if low power is used). The rocket would be tracked and navigated from perhaps four stations well separated in longitude (since the earth rotates, we would want to have a number of stations so that the rocket could be viewed from at least one and preferably two at all times).

The configuration results in a rocket that would take two and one-half days to make the earth-moon voyage. The tracking parameters desired for measurements desired are: range; range-rate angles; angular rates with respect to some earth reference.

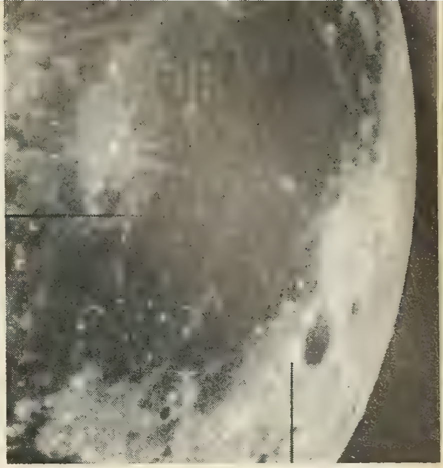
To obtain range it was suggested that a transponder beacon be used in the rocket, and rate could be obtained from the Doppler frequency shift, assuming that the beacon were sufficiently stable.

• **Two approaches**—Current proposals to place a vehicle in the vicinity of the moon are based on two philosophies: to use military off-the-shelf rockets to keep costs down and help insure reliability. Such an approach would undoubtedly speed up the moon program, and, in the earth satellite field, is exemplified by successful Army *Jupiter-C/Explorer* tests.

The second visualizes large ballistic rockets to boost tailormade research missiles. This is essentially the *Vanguard* approach, and while the equipment might be more sophisticated it would face the long series of delays and failures which plague any new rocket.

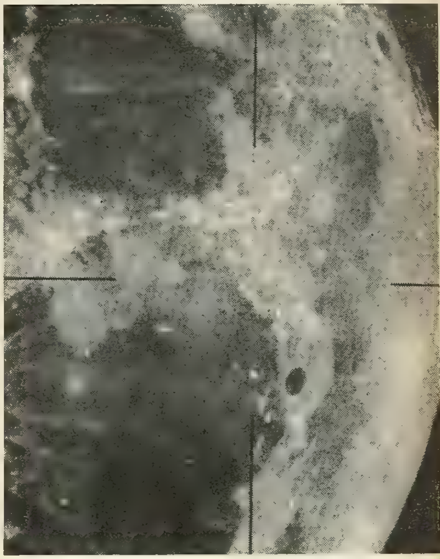
The Air Force Office of Scientific Research has contemplated the use of a long-burning, slow-accelerating booster rocket to minimize the problem of aerodynamic heating. Intermediate stages would then move the rocket out from the earth and the final stage, with a thrust of 50,000 pounds, would propel the vehicle into the moon's gravitational field. Booster candidates include any of the five current ballistic missiles: *Jupiter, Thor, Polaris, Atlas* and *Titan,* or the large 400,000-pound-thrust *Navaho* rocket engine. Aeronutronics has also proposed the use of existing off-the-shelf hardware based on *Far Side* but which would be in five stages as follows: cluster of four *Sergeants,* single *Sergeant,* cluster of three solid rockets (of type used in third stage of *Vanguard*), *Vanguard* third stage, and one scale *Sergeant* for the last stage.

Other projects involve impacting a rocket on the moon, especially with regard to causing either chemical or nuclear explosions on the lunar surfaces. Dr. S. Fred Singer proposed last year that useful scientific information could be gained by exploding



Perkin-Elmer

CAMERAS on Earth can see only part of the detail . . .



Perkin-Elmer

EVEN on closer view, more men must know about the Moon.

...Man on Moon?—Others Have Plans

an atomic bomb on the moon and analyzing the results. Such experiments are discussed in a later section.

• **Russian moon programs**—The West has no monopoly on moon projects. Russian scientists have long been interested in the prospects of moon travel, and their literature is well filled with both general discussions of the subject and more specific studies.

M. K. Tikhonravov, nearly eight years ago, wrote on a trip utilizing a rocket weighing 1000 tons, sent off with a velocity of about 11 km/sec. It would carry two men who would circle the moon once and return to the earth. If departure from an earth satellite was assumed, the vehicle would weigh considerably less (approximately 100 tons), and would take off with a velocity of 3.5 km/sec.

Other reports of about the same period suggest that a moon rocket had already been designed, that it was to be 60 meters long, have a maximum diameter of 15 meters, weigh 1000 tons and have 20 motors building up to 350 million horsepower.

Yu. S. Khlebtsevich has laid out a rather definite program for a lunar landing. In it he points out that we must know thoroughly the environment into which man must travel; insure the safety of the crew during takeoff, flight and landing maneuvers; and make full provision for return to earth. He emphasized that more complete information must be made available on the perturbations that would be encountered during the trip and their influences on flight trajectory.

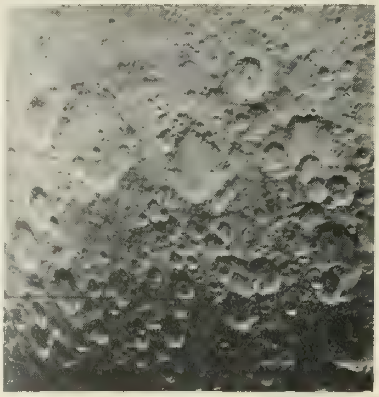
The Russians also suggested a radio-controlled, television-equipped, tank-laboratory to be set on the moon to give scientists a chance to observe the surface from close up.

Khlebtsevich assumes that man will want to stay on the moon for a considerable time and that his supplies will be delivered by radio-controlled rockets coming up from terrestrial bases. The early explorers would be in radio and televison contact with the earth and their actions would be constantly controlled by scientists and medical specialists, somewhat as was Major David Simons in the *Man-High* tests.

• **Automatic landing**—To assist in the automatic landing maneuver, the Russians suggest use of a very powerful terrestrial radar station, with a huge parabolic antenna aimed at the moon.

The following is from a translation of Rand's CASEBOOK ON SOVIET ASTRONAUTICS (RM-1760):

"Altimeters aboard the rockets receive the short impulses of this radar reflected from the moon's surface. They determine the distance between the rocket and the lunar surface by measuring the interval of time between moment of flight of the radiated impulse past the rocket and receiving the radio echo reflected from the moon. The automatic landing device aboard the rocket, utilizing the data of the lunar altimeter, at the appropriate time turns the rocket with its tail section to the moon, and, according to a special program, guides its jet engines in the regime of braking. Finally the rocket reaches the goal of its journey and lands on the lunar surface."



Perkin-Elmer

REAL CLOSE-UP views can add much to knowledge of problems.

U.S. Navy

MOON over horizon (picture is on edge) in powerful lens.

N. Varvaros, chairman of the Astronautics Section of the Chkalov Central Aero Club, said in an article on moon flight in 1955:

"The general construction scheme of a rocket for flight to the moon . . . may be approximately as follows:

"The first stage (in order of operation) must have turbojet engines; the second, ramjet engines; the third and others liquid rocket engines."

The author is assuredly conscious of the need for fuel economy, and his proposed use of turbojet engines as propulsive devices for booster stages has recently been promoted in the United States.

Last year, m/r carried a report that Prof. G. A. Chebotarev (of the USSR Academy of Sciences' Institute of Theoretical Astronomy) had suggested sending automatic rockets into lunar space. With a total flight time of about 10 days, rockets might be sent to within 3100 miles of the moon's surface.

• **Active planning**—Other sources indicate that the Russians are actively planning instrumented lunar probes equipped with television-type cameras.

At the very least it is believed they desire to establish a radio transmitter on the moon, which would send back to earth such basic measurements as surface temperature conditions.

That the Russians have made more than general studies of moon travel is evidenced by Egorov's paper entitled "Some Questions on the Dynamics of Flight to the Moon" which appeared last year. The author reports that over 600 trajectories were calculated.

Many experiments can be conducted on the moon's surface. Scientists would want to determine accurately the lunar mass, gravity, hardness and composition of the surface and interior. Seismic studies of the crust and core, temperature measurements of the surface and subsurface, and the composition of the lunar atmosphere (if one exists) would be obvious candidates for investigation.

• **Moon conditions**—It should be noted that, as on the earth, lunar gravity will vary slightly from place to place; the exact variations will be determined only after a prolonged period of exploration. As this exploration proceeds it will be possible to determine the moon's mass very accurately. This is a somewhat more difficult experiment since it will be necessary to know the average diameter, as well as the true shape, of the moon.

Some authorities have suggested that the lunar surface may be covered by a thick rather than thin layer of dust. If this proves the case, it would be a major hazard both to vehicle landings and exploration; hence it would be advisable to have precise knowledge of surface conditions. Here again, a probe vehicle, launching small explosive rockets onto the lunar surface and recording the results, would provide invaluable information to manned vehicles.

A thorough chemical analysis of the constituent parts of the lunar surface will be high on the agenda of early exploration. From studies such as this we shall learn much of the formation of the moon, and of meteorites and interplanetary matter which should be abundantly available at or near the surface.

The moon's structure will be searched for sufficiently valuable minerals which could justify their being mined and ferried to the earth.

• **H-bombs on the moon**—It is not yet known definitely whether or not the moon has a molten interior. If it should, the thickness of the outer crust would be an immediate problem. An atomic explosion on the lunar surface would produce a shock wave that would tell much about the subterranean structure. It would necessitate another instrumented probe or observation base, located at a known distance from the explosion, to validate the experiment. An atomic explosion on the moon could also be observed from the earth, and thus, by analysis of the spectral distribution of the resultant light source, we would learn of the elements present in the impact area.

A major area of contention among scientists is the presence or absence of a lunar magnetic field. Some authorities feel that the proximity of the earth to the moon almost certainly will have oriented the ferro-magnetic elements of the latter body to provide at least a weak magnetic field.

It is generally held that the moon has no atmosphere, but this may be qualified by stating that some of the heavier gases may be contained in the lunar crust, and that some atmosphere may be found in crevices and gullies.

Experimentation by probe to detect a tenuous atmosphere by spectographic means would be difficult. It is most probable that this experiment will await the advent of man on the surface, or at least will not be attempted prior to establishing lunar satellites.

Temperature variation determinations, like atmospheric calculations, may best await the landing of a manned rocket, since greatly separated distances will have to be checked to correctly map this parameter. Probes could be utilized, but so many would be involved that it would probably be economically out of the question. At present earthbound infrared and microwave radio detectors can be used to measure the radiative temperatures of the lunar surface, and of course thermocouple techniques are widely employed.

• **Moon bases**—An extremely important fact which must be determined is the impact frequency and size of meteorites. With such data, it will be simpler to construct a base of operations for major exploration. This base could also provide some protection from cosmic rays, a hazard which has not been fully determined.

Early moon explorers will almost certainly use their landing vehicle as a base of operations, but space and weight considerations will reduce the living and working space to a minimum. To avoid this cramped atmosphere, small camps will have to be established on the lunar surface. Arthur Clarke has suggested that double-walled balloons inflated to about five pounds per square inch, and anchored to the ground, would be suitable.

Space and weight requirements for such equipment (shipped aboard the exploration craft) would be low. After inflation, a hard-setting plastic could be sprayed to prevent the balloon from collapsing should a large meteorite puncture the structure. The smaller, more common type of meteorite (less than a millimeter in diameter) would produce a hole which could be easily sealed.

It would be advisable to further protect the inflated balloon base by concealing it in a cave or crevice to ensure maximum protection for the occupants. Since early expeditions will be of short duration (probably two weeks or less), a permanent base would not be considered. The basic requirements for this minimum base would be a power source, an air-conditioning unit, an atmosphere and a heating unit.

By utilizing a mirror or highly polished reflector, the sun's rays could be concentrated onto a tube containing a liquid. The liquid would be vaporized and the resultant steam would drive a turbine, to produce the desired power. A sun-follower would be needed to continually orient the mirror.

It should be noted that two weeks of sunshine will be available before lunar nightfall.

• **Permanent base**—In time, a permanent lunar base will be established. The advantages of establishing such a base, from the scientific or military viewpoint, are as manifold as the difficulties associated with such a project.

The equipment and machinery payload of these freight rockets will all be specially designed for this single application. Special machinery would include rock drills, tractors and trucks.

Construction materials would have to be quarried and butt-joined together as accurately as possible since concrete could not be used in the form we now know it.

• **Moon colonies**—Eventually the moon may be colonized by several nations. Territorial possession will almost certainly be based on establishment of permanently manned bases, since no one is likely to be impressed by claims resulting from short-lived expeditions.

One of the more critical problems will be that of supplying food to the residents. Hydroponic gardening has been suggested.

It may be that in the distant future small cities will be constructed, completely enclosed by a structure permitting a reasonable facsimile of earth conditions to prevail. This would be a mammoth undertaking, but today's progress in all phases of the overall problem may well herald the laying of a lunar city's cornerstone within 25 years.★

Selling Space Ships

by Seabrook Hull

IF YOU THINK selling missiles is baffling, try space ships. If you think missiles are expensive, try spaceships. If you think missiles present the toughest engineering problems, try spaceships. And if you think missiles have a future, try spaceships. There is not and never has been anything quite like them.

The market for tomorrow is small now, relative to that for missiles, but it will grow and grow until it becomes bigger than any military market heretofore seen in history. Russia will guarantee it. If you want in, now is the time to begin your sales campaign.

As missile buyers and missile makers alike once tended to lump manned aircraft and rocket-powered missiles in the same general technological category, they now look at the spaceship merely as an extension of the missile. Not only is this fallacious, but it can get all of us in a lot of serious trouble. The businessman that uses it will have trouble getting contracts, and those he gets will cost him and the taxpayer undue time and money. The military service that uses it will find itself with an operational requirement, but no operational hardware. And the country that uses it is liable to awaken one day to find that another country—namely Russia—got there "firstest with the mostest."

The space ship business is now largely in the feasibility study stage. Except for jury-rigged-but-effective devices using available military missiles, such as Army's *Jupiter-C*, there are no original space-flight projects in even the initial prototype assembly stage.

Whoever goes out into the market place now to sell spaceships had better be prepared to sell ideas and concepts first, rather than hardware. The first step is to convince your customer that space flight in any form really is feasible. He may be willing to spend a little money to be convinced—say, the cost of a feasibility study contract. But he's most unlikely to commit tens or hundreds of millions of dollars for hardware just on your enthusiasm and say-so.

Selling ideas is pretty much the same kind of marketing problem as selling products, though perhaps a little tougher because you don't have something solid to show your customer—something he can see and handle. But just as a piece of hardware must be mechanically convincing, so must an idea be fully supported with technical data, background experience, unassailable logic, etc.

The first thing to do in selling spaceships is to survey your market. Note who has the money; if possible, how much. Find out what's wanted, and establish an order of priority for various projects under consideration. If you're after a prime contract, investigate the three military services. If you're willing to take a subsystems contract, find out who's dickering for a prime contract and go to it. Maybe you're in a position to join forces with other companies with complementary capabilities to present a comprehensive proposal.

The group method of systems contracting has been given official approval by the Air Force and is probably acceptable to the other services as well. One company must assume the systems responsibility. This entails concept and coordination.

Once you've surveyed your market, check requirements against your (or the group's) capabilities. In the beginning, great assembly lines of production equipment are no asset. For a study contract you need a research and development staff, i.e., you need brains.

Once you've decided just how you may fit into the picture, find out who's doing what—now. For example, currently the U.S. Air Force is holding a series of meetings with a target of placing a study contract during May for a "Global Surveillance System." If you've got an idea for such a system, you should be present. But you are present by invitation only. So, get invited. This may be primarily a public relations job.

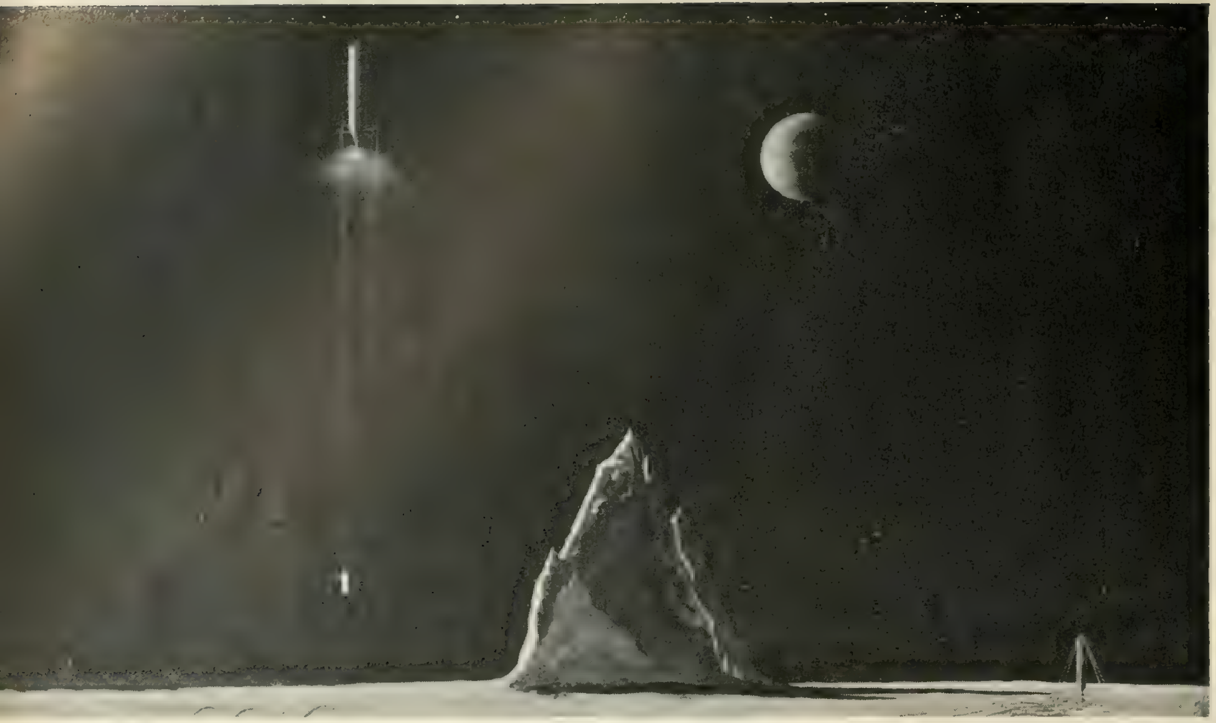
Itokawa

But once invited, have your ducks all in a row before attending. Remember, your customer has called on you for ideas—your ideas. He probably won't have much to offer, except by way of questions that aim at poking holes in your proposal. Have a complete package—the basic concept clearly presented; the arguments and supporting evidence methodically arranged; proof of your capability.

One thing that frightens your customer about space flight is its apparent staggering cost. Think your proposal through. Let ideas, creative engineering or what-have-you substitute for dollars. In other words, if your proposal is technologically and operationally equivalent to another, but yours is cheaper, you'll get the contract.

Another thing to keep in mind is that space flight is an entirely new realm. It is susceptible to entirely new approaches. In seeking your "ideas," start with the basic problem—say, to place man operationally in space for a period of three days. This would be a requirement. Get rockets, airplanes and everything else out of your mind. Revert to basic technologies. Apply them to the problem without prejudice of prior convention. Take an original approach.

To really gain a proper knowledge of your market's requirements, you should survey it yourself. Check these areas: getting man into space; keeping him there; getting him back; giving him tools to work with in space; giving him weapons (bombs and rockets are most impractical); landing him on the moon; new propulsion systems; materials in a new environment.



Itokawa

Problems in Space Navigation

Complex mathematics, design of vehicle involved in solution

by Louis G. Walters*

MOST OF THE INFORMATION regarding the external physical environment of the earth has been derived from radiation passing through the atmosphere

The benefits to mankind from the extension of knowledge of the universe can be foreseen only in a vague way, but there is little doubt that there is much to be learned, and that this knowledge will have a profound effect. Examples from the past are numerous; the most obvious being the slow development of knowledge of the nucleus of the atom, partly obtained from astronomical observations, which culminated so spectacularly in the energy of fission and fusion, after the means of exploring the nucleus were available.

Only recently have advances in the arts of propulsion and guidance made serious consideration of space exploration possible. Beyond the earth satellite, the orderly development of our knowledge of the solar system (and political considerations as well) leads to the moon as the logical second step into space.

- **Easy target**—Viewed as a target, the moon does not pose a difficult aiming problem. It is relatively large, subtending an angle of nearly one-half degree from the earth.

Its mass, 1.23 percent that of its parent, contributes to a larger apparent capture diameter through gravitational means. This apparent enlargement is most pronounced for low-approach velocities and can enlarge the capture diameter by a factor of 3 for fairly low-energy trajectories.

It travels in a slightly eccentric orbit, the plane of which is inclined to the ecliptic by 5°. Its perigee and apogee distances are 22,463 and 252,710 miles respectively, reflecting an average eccentricity of 0.055.

The period of rotation, or true month, is 27.32 days, leading to an average angular rate of rotation about the earth of about one-quarter radian per day.

The lunar orbit intersects the ecliptic at two nodes; regression of these nodes in a westward direction along the ecliptic has a period of 18.6 years.

These characteristics of the moon are useful in feasibility or "design" studies of the translunar trajectory wherein basic vehicle performance and trajectory error sensitivities may be assessed.

On the other hand, data required for precise navigation to the moon must be derived from astronomical sources such as the NAUTICAL ALMANAC, due to rapid changes which occur in the moon's orbit. These considerable month-to-month variations in the apparent lunar course are due principally to the influence of the sun.

**Aeronautic Systems, Inc., Los Angeles*

• **Design and/or navigation**—Note that a distinction between design and navigation studies has been made.

In the design, a simplified model of the earth-moon system is adapted. This leads to good engineering estimates of the rocket components' required performance.

These same studies, however, do not provide a basis for formulating firing tables, since they ignore many important perturbing influences on the translunar trajectory: they provide the basis for overall vehicle design, but cannot identify the location, time and direction of launch required to achieve lunar impact in practice.

But navigation studies require consideration of all factors that serve to determine the course of the vehicle relative to that of the moon, and the use of mathematical techniques which will lead to a precise end point.

Another contrast is the relative emphasis placed on design and navigation studies. Design studies have been conducted by groups interested in lunar impact and have tended to instill a high degree of confidence in investigators.

The navigation problem, however, is far more complex and has received only superficial consideration.

• **Design studies**—Determination of the translunar trajectory involves integration of the equations describing the restricted three-body problem in an appropriate coordinate system.

For design purposes, a simple model of the earth-moon system, consisting of a planar representation of the earth and moon, with each moving in a circular path about their common center of gravity (barycenter), has been widely used. This model (Fig. 1), with the x axis linking earth and moon, demonstrates the degree of apparent distortion arising from the rotation of the coordinate system, for it would be nearly elliptic in inertial space.

Fig. 2 is typical of trajectories where the energy is relatively low. As a result, the speed of the vehicle as it approaches the moon is low as well, and the resulting capture cross section is several diameters.

This effect is clearly shown by the group of trajectories which impact the moon and which represent the influence of initial variation in path angle over a range of 1.5 percent compared with its projected diameter of .5°.

The sensitivity to launch velocity is quite considerable; for the case shown, the variation of 50 feet per second displaces neighboring trajectories by 16,000 miles as they approach the moon. Noting that the capture diameter factor of the moon is about 2.5 to these low-energy trajectories, this limits the allowable velocity error to a range of 15 feet per second. Coupled with the careful velocity control, which must be exercised by guidance equipment, is an arrival time predictable to 0.5 hour.

As the energy of the vehicle is increased, the character of the trajectory sensitivity to initial condition changes markedly. Since the approach velocity increases as well (and at a much faster rate than the launch velocity) the effective capture diameter shrinks to the actual lunar diameter and modest path-angle errors are no longer tolerable.

The intercept also takes place on a portion of the trajectory which is not strongly displaced by velocity uncertainties, and larger velocity errors are tolerable.

As the trajectory energy is increased beyond that corresponding to escape, the moon's own motion begins to play a constructive role in the guidance mission. This effect is associated with a class of trajectories which are designated "high-energy" trajectories in contrast to those that have been considered earlier.

• **Lunar motion effects**—The role lunar motion plays in the guidance mission for a high-energy trajectory is described in Fig. 2.

Several trajectories, differing only in velocity, start from a given point near the earth and proceed out along the designated paths.

The outermost trajectory corresponds to the highest launch velocity and therefor will reach lunar distance earlier than the others. Meanwhile, the moon is also moving in its orbit, and the distance which it moves in the differential arrival time of two neighbor-

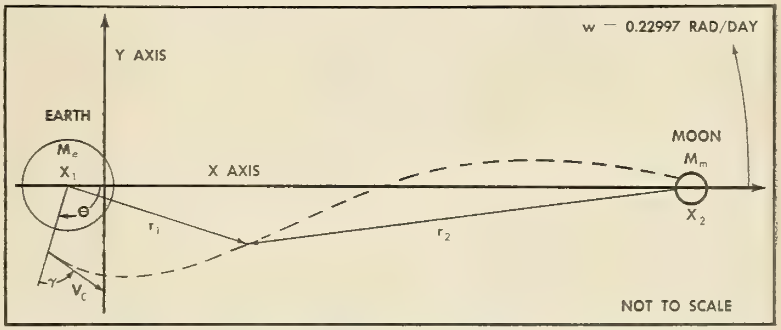


FIG. 1—Trajectory format for Earth-Moon rocket studies.

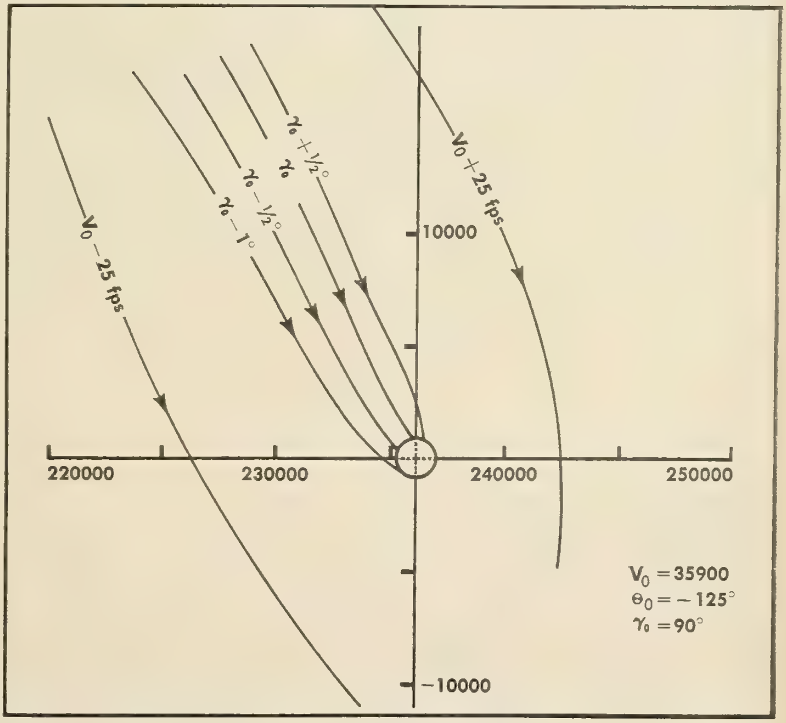

FIG. 2—Terminal trajectories for low-energy perigee launch at 100-mi. alt.

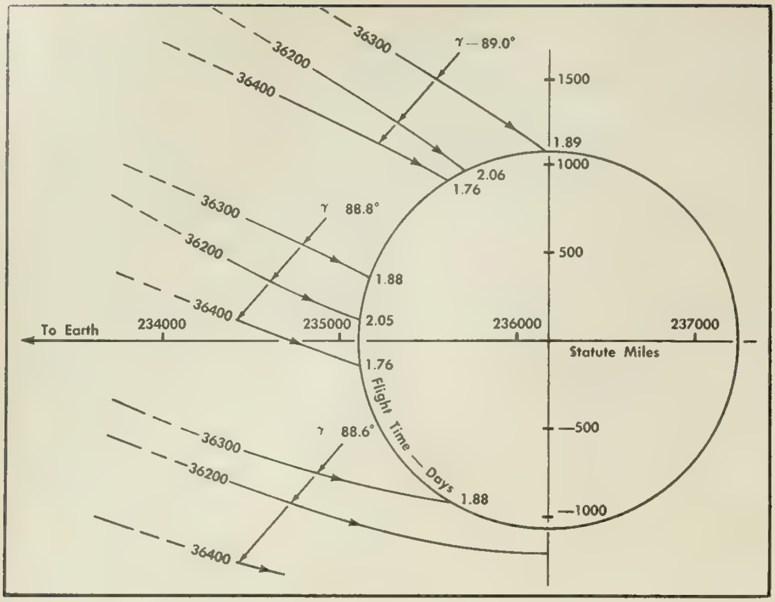

FIG. 3—Terminal trajectories for 100-mile launch: $\Theta = -$ N135°.

ing trajectories can be readily calculated.

If the differential arrival time of two neighboring trajectories can be adjusted so that the corresponding lunar displacement in its own orbit is identical to the physical displacement of the trajectories themselves, then lunar impact will occur in both cases.

The important consideration insofar as the launch is concerned is the required lead angle by which the moon initially leads the launch point. This lead angle can be computed for a Kepler orbit, ignoring the influence of the moon, and demonstrates, for velocities slightly higher than escape, a stationary value of required lead angle even as the velocity is varied over several hundred feet per second.

Thus, exact knowledge of the final velocity in this interesting situation is not required prior to launch.

A number of terminal trajectories which display this effect are given in Fig. 3. The design velocity in this case is in the neighborhood of 36,300 feet per second.

Clearly shown is the influence of variations of 100 feet per second on the impact point. As the velocity increase toward the design value, the impact point moves up the face of the moon; for higher values, the impact points then begin to retreat.

This effect can be utilized for a lunar impact mission. Careful control, of the path angle must be maintained.

This class of trajectories requires substantially more velocity than the low-energy class and, a greater expenditure of propellant is required to place payload on the moon.

The offsetting advantage is that little of this payload need be expended for guidance purposes. An additional consideration is that the arrival time at the moon will be uncertain by about three hours as in the case shown. This time uncertainty somewhat restricts the flexibility of the lunar mission in a manner which is not readily demonstrated in this two-dimensional analysis.

• **Navigational aspects**—The navigational aspect of the translunar trajectory is best visualized in terms of the projections of the orbits on a geocentric celestial sphere (Fig. 4).

The rocket is launched at the designated point and, for eastward travel from a launch point in the northern hemisphere, describes a course crossing the projection of the equator at a longitude some 90° east of the launch site.

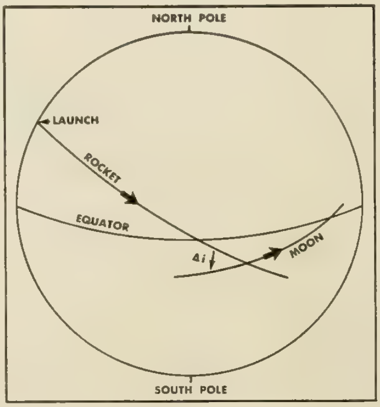

FIG. 4—Geocentric celestial sphere.

For a launch in a northerly direction, the rocket orbit would intersect the equator further east; in the case of a northward launch, this intersection would occur 180° east of the launch point. The lunar orbit, on the other hand, describes a path whose maximum declination depends on the relative orientations of the lunar orbit and of the earth's axis with the ecliptic.

The maximum inclination of the lunar orbit from the equator occurs when the ascending node coincides with the vernal equinox, and is 23.5° + 28.5°.

This situation existed in 1950 and will recur each 18.6 years as the lunar orbit plane regresses. Midway in this period, in 1959 for example, the inclination will reach only 23.5° −5° or 18.5°.

The angle of inclination between the rocket and lunar orbit planes at intercept is designated Δi. A desirable situation, assumed to exist in the design studies discussed earlier, is that these orbits are coplanar and that the problem is essentially two dimensional.

The ability to achieve this in practice depends on the latitude of the launch site and the maximum lunar declination. For a launch site located at higher latitude than the maximum lunar declination, coincidence of rocket and lunar planes is not possible.

The ideal situation involves launch from a site whose latitude corresponds to the maximum lunar declination, for under these conditions an eastward direction is required and the earth contributes the maximum velocity component due to its rotation.

From a practical point of view, a lunar mission originating from within the United States involves latitudes in excess of 28° and, as a result, the minimum relative orbit plane inclination Δi during 1958 will be 8°; this will increase to 9.5° in 1959 and will then decrease toward 0° in the late 1960s.

Fig. 5 demonstrates the azimuth heading required during 1958 from a launch latitude of 28° north as the lunar declination varies between its extremes (half lunar month) and for a typical low-energy trajectory. Also shown is the inclination angle between the orbit planes, Δi.

It is interesting to note that for launch latitudes less than 18.5°, it will always be possible to place a rocket vehicle into an orbit coplanar with that of the moon, at some time(s) during each month.

• **Uncertainty factor**—An interesting contraint on launch times is imposed by the uncertainty in flight time.

The design studies have associated arrival time uncertainties of 30 minutes and 150 minutes from design values for low- and high-energy lunar impact trajectories respectively. During this time uncertainty the moon can move an appreciable distance and, if the trajectories are not coplanar, a cross-trajectory impact error will result (Fig. 6).

For the high-energy case, the arrival time uncertainty of 150 minutes will tolerate orbital inclination of 10° without displacing the rocket more than 75 percent of the effective radius out of the lunar orbit. Under these conditions, Fig. 5 demonstrates that operations in 1958 from Florida, for example, must be confined to the period when the declination is between +5° and −15° on the southbound leg. Reference to lunar tables demonstrates an allowable launch period of five days in each lunar month for this high-energy case.

The low-energy trajectories do not suffer from large arrival-time uncertainties and, additionally, the effective lunar diameter is substantially greater. As a consequence, even the largest inclination given in Fig. 5 will not cause substantial cross-trajectory displacements.

Another important consideration is the actual computation associated with the navigation problem: this will differ in considerable detail from that used in determining vehicle design parameters, using a rotating two-dimensional coordinate system. For computations leading to actual firing data, the model must recognize these factors: (1) launch point latitude; (2) earth rotation; (3) lunar motion in declination; (4) structure of the lunar orbit; (5) perturbations of sun and equatorial bulge.

The advantages of a rotating framework vanish entirely when these are considered, and the computation must be three dimensional in any case. In addition, the reference frame for both launch point and moon are affected by precession and nutation and, consequently, are not inertial.

Another consideration is the means utilized for integrating the equations of motion. The accumulation of end-figure errors is often damaging in numerical integration, particularly where the number of steps is very large. The use of Cowell's method, for example, requires the integration of the total acceleration on the vehicle, and both the size of the terms and number of steps lead to substantial end-figure error.

Alternatively, a technique such as Encke's integrates only perturbations from a reference two-body orbit and the number of steps required is small, particularly in the critical early stages of flight.

Whatever technique is used must also provide a bound on the end-figure error so that the validity of the computational procedure may be assured.

• **Credits**—For those interested in pursuing this subject in detail, a list of references is included, which will provide foundations required for detailed studies of this problem. The author is indebted to Samuel Herrick and Robert M. L. Baker for their many constructive suggestions.★

Ground Support: A Must for Space

by Robert J. Laws*

MAN'S INNATE DRIVE and curiosity will never be satisfied until every new frontier has been explored and conquered—and space is the latest and most challenging frontier to confront him. The problem of devising the equipment to conduct this exploration is a tremendous one.

• **What's ground support?**—Ground support can generally be considered to encompass all items of a system other than the flight unit itself.

Unless ground support is taken seriously now, the flights of our guided missiles will be delayed. And, if the flights of the guided missiles are delayed, or the perfection of the overall system is delayed, because development of ground support equipment was left to the very last, we will ultimately delay realization of space flight.

The guided missiles and rockets of today are the true building blocks of space flight.

Conversely, if we do keep the proper balance between development of ground support equipment and that of flight equipment—insuring that the interim step of guided missiles and rockets is accomplished by developing all of the arts and techniques simultaneously—then we will stand a far better chance of achieving space flight in the shortest time and in the most efficient manner.

• **Can't ignore it**—The usual first reaction to the ground support side of the problem is something like—"Oh, we don't have to worry about that . . . that will be solved in plenty of time . . . those are arts and techniques that we know today . . . what we need is the guided missile, and then the satellite, and then the space station and from there we can just take off and go on . . ."

The first step should be to work with the guided missile and rocket developments of today. By making integrated ground support equipment a requirement, the groundwork for development of future systems is laid. Ground support would become an art . . . and would start the development of techniques and the training of people for the future work that will be required for outer space support.

The missiles being placed in our service arsenals take on different physical characteristics as a function of desired performance. There are the small air-to-air birds, the slightly larger surface-to-air and so on to the strategic monsters in the ICBM surface-to-surface category. These different "birds" require basically different types of ground support, each according to the various factors involved; i.e., whether the bird is to be employed tactically or strategically; from fixed or mobile positions; the type of fuel, rate of fire and many other physical factors.

• **Ground handling systems**—A closer examination of just one phase of the missile ground support system—the handling complex—emphasizes that the major difficulties experienced in supplying equipment for the system begin in the manufacturer's plant. As the subassemblies become assemblies, they must be moved from operation to operation, perhaps to preliminary checkout, and ultimately packaged and loaded for shipment.

And the package must be handled in much the same manner that it will be handled by the using unit. In some instances, upon receipt it will be stored and again moved prior to unpackaging. Then might come assembly of the various components, perhaps a checkout stage or flight simulation. Next, the

---

*Baker-Raulang Co.,
Cleveland, Ohio*

components may be disassembled, repackaged, again handled and transported to lower echelons, the firing unit, or returned to the factory.

The firing unit may be anywhere from just outside the manufacturer's plant, as in the case of surface-to-air defense missiles, to any of our missile ships, or tactical and strategic air and land force installations located throughout the world. Ultimately the weapon must be loaded on the firing or launching device–which itself may range from the simplest stand or aircraft zero-length launcher to the complex, remotely controlled, trainable and elevatable launchers.

Up to this point, discussion has been limited to two of the variables which make handling of missiles slightly different from the handling of other commodities, but this is only the beginning.

What is it about the guided missile that dictates special equipment and techniques for handling? Certainly it is not the need for handling and rehandling, nor that it must be transported long distances. But the basic size and shape—in general, a long, cylindrical object with or without wings and fins—is one factor. Secondly, in many cases, this long, cylindrical object has no beam strength in itself and must be supported or cradled in some fashion at several points or through its length.

• **Shock and vibration**—As a general rule, the missiles contain electronic components or propellants which are vulnerable to excessive shock and vibration. Also, the load center, or gravity itself, changes with the various conditions of preparation. For example, a fueled missile or an unfueled missile, or a missile with a separate booster may vary the center of gravity (c.g.) location as much as 50 percent of the length of the load.

These are but a few of the factors which make this a special handling job and, of course, they are the result of the physical properties of the load itself. The problem further complicates itself when consideration is given to the operations in which the missiles will ultimately be involved. For example, there are requirements for extremely rapid handling—in the case of sustaining a given rate of fire when using the missiles as weapons. There may also be requirements for storage or protection from the elements which further complicate the handling problem. And, there is the further problem of handling long loads in confined spaces—such as aboard ships, submarines and, in some instances, aircraft.

• **Terms defined**—Still on the subject of handling the missiles, three terms should be defined in the fundamental vocabulary of the guided missile handling engineers. These are: "multipurpose, compatibility, standardization."

"Multipurpose Handling" — As mentioned earlier, the missile requires multiple handling operations in many locations and under varied conditions. The approach taken today is either the extreme of doing nothing and "making do" with jury-rigged equipment at the last minute; or designing a special piece of equipment to handle the missile under each of these sets of conditions. Multipurpose means simply that "equipment designed after considering all of the handling, situations through which a missile must pass from its fabrication to its firing, the irreducible minimum of handling devices."

For example, consider the multitude of handling operations described previously. A cradle could be designed so that it could be used as a part of the handling equipment in the manufacturer's plant, perhaps used as the assembly dolly for joining the subassemblies to form the finished product, and later used as a part of the packaging for shipment of the unit. Also, the device could be an integral part of the checkout equipment and/or the flight simulator. Perhaps, ultimately, the same device could become a part of the loading equipment for the missile.

This may be stretching the multipurpose concept just a little, but there undoubtedly is an optimum point somewhere between our position today and the concept just described. A positive effort must be made to develop multipurpose equipment and this is no small task. It requires that the technologies of shock, vibration, fueling, environment, handling and all the other facets of the problem be considered simultaneously by the ground support engineer.

"Compatibility"—There must be compatibility of a missile system within itself. The handling equipment with respect to the missile; the missile with respect to the launching device; the compatibility of the checkout equipment; the flight simulation equipment with the missile and with the launcher. This is all tied to the ultimate mission of the missile—whether it be a mail carrier, a weapon in the armed services arsenal, or a scientific research vehicle.

The need for compatibility is obvious. No one would use a ten-ton truck to carry a one-ton missile, nor provide a 50-gallon fuel trailer for servicing a missile requiring 500 gallons of fuel.

A planning program must extend further into the future than that. For equipment to be compatible, one item with another, within a system, it is necessary to set down the ultimate goal and consider every element at the moment design starts, so that each block of the pyramid fits together snugly.

"Standardization"—This term is a familiar one in the missile profession. When we speak of standardization as a fundamental requirement, we must digress from the close look at one system of space-flight equipment and group several systems into their natural families, just as the guided missiles of today group themselves into the surface-to-air or air-to-air or surface-to-surface categories.

Within a given category, then, there are undoubtedly instances where the size, weight, configuration of a weapon or the ground support requirements are similar. Knowing this to be the case, comparable systems can be laid out side-by-side, common ground found, the common items of equipment that could be used from one system to another system determined. and thus the pyramid block of "standardization" will be in sight.

Digressing again from the pure handling problem to other facets of the ground support problem, other possible fields of standardization materialize.

For example: flight checkout equipment, or flight-simulating equipment. This, of course, varies all over the lot from the "go, no-go" type test, to the elaborate laboratory test. Nevertheless, there could be common components across system lines. There are the dc amplifiers, charging units, transducers, in any given system—but have you ever heard of using a unit from one system in the other? Or something as simple as the fittings on a missile for supplying external air, or hydraulic oil or fuel?

• **Much to be done**—There is, thus, a lot that can be done about the current problem of ground support.

A project should be planned for maximum utilization of equipment, striving for compatibility and with specifications written which require standardization. This can be done for handling equipment, for servicing units, for fuel trailers and for checkout equipment and all the other items which make up the ground support equipment.

Actually this is a natural evolution that has taken place in every other program, system, or development that mankind has undertaken. All programs must and will continue to evolve, and they undoubtedly will be better for the extra time and experience devoted to them.

We are not, in general, giving ground support the attention that it deserves.★

Internal Dangers Threat in Space

by Alfred J. Zaehringer

WHENEVER manned space flight is considered, the subject most discussed is the problem of external hazards: cosmic rays, meteorites, gravity, etc. But internal hazards may be deadlier.

Two of the most obvious manned-vehicle problems are control of a synthetic atmosphere and the rocket-powerplant hazard.

Control of a suitable closed-cycle atmosphere is just now receiving attention. Improvement of rocket powerplants is now aimed at bettering reliability—especially for manned vehicles. But in any case, the pilot will be sitting on tons of usually extremely toxic chemical propellants. In addition to the chemicals, there are other contaminants—metallic poisons, and dusts.

Even in very small concentrations, exposure to propellant and chemical leakages and vapors could be very hazardous, especially for long periods.

Duration of endurance flights has been increasing, and manned rocket craft will certainly follow this trend: even the shortest manned flights may be a matter of days. For a manned satellite, the exposure time may be considerably longer. The greatest danger will come from the huge amount of chemicals that the rocket will carry. Leakage and subsequent liquid infiltration or vapor transmission into the habitable sections will cause a big problem. Even if the manned section could be completely encapsulated, there would be a secondary effect—chemical action on the capsule and possible subsequent contamination of the atmosphere.

The capsule itself will be subject to wear, which might give rise to metallic dusts. The slow decomposition products of solid propellants also could be dangerous.

Detection of all possible health hazards will have to be automatic. The human nose cannot be relied on to detect all toxic materials, since many chemicals that could be hazardous have little or no smell, or are not detectable by odor until rather high and dangerous concentrations arise. In some cases, symptoms do not show up immediately. Therefore, manned space satellites and long-travel-time vehicles will have to be equipped with detection systems.

In addition, such a "space sniffer" will have to furnish qualitative and quantitative information, and be ready to make the necessary corrections. It is likely that many of these operations will have to be relegated to the oldest detection/analysis/action system known—man himself.

Table I: Oxidizers and Monopropellants

Compound	MAC	Odor	Symptoms, Effects
Ethylene oxide	25-100 ppm		Eye irritant; kidney damages
Fluorine	1-3 mg/m^3	Pungent	Skin attack; throat, eye irritant
Fuming nitric acid	10 ppm	Acid	Eye, skin irritant; severe pulmonary damage at 200-700 ppm
Hydrogen peroxide			Mainly skin or eye irritant
Liquid oxygen		Odorless	Nontoxic; skin damage due only to cold liquid
Nitroglycerin	0.5 ppm	Ethereal	Headaches; reduced blood pressure
Nitromethane	50-200 ppm	Ethereal	Attacks nervous system, liver
Ozone	0.1-1.0 ppm	Pungent	Detectable by odor at 1 pp 500 million (skunklike); eye, throat irritant at 300 ppm; fatal in 2 hrs at 400-10,000 ppm
Tetranitromethane	0.1-0.5 ppm	Ethereal	Very toxic; eyes, lungs, liver damage; fatal in 10 min at 10 ppm

MAC: maximum allowable concentration PPM: parts per million

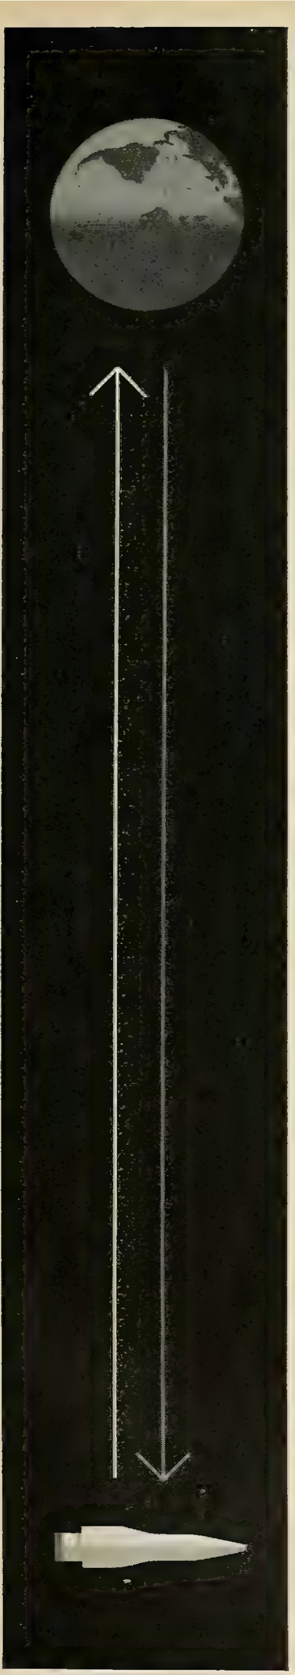
Table II: Fuels and Chemicals

Compound	MAC	Odor	Symptoms, Effects
Aniline	5 ppm	Oil-ammonia	Absorbed through skin; eye irritant; 100-150 ppm exposure for 1 hr w/o serious effects
Ammonia (Anhydrous)	100 ppm	Pungent	Eye, skin, throat irritant; detectable odor 53 ppm; 300 ppm, maximum tolerable for several hrs
Carbondioxide	5000 ppm	Odorless	Increased breathing rate, paralysis of respiratory center; 120,000-150,000 ppm causes rapid unconsciousness; death after several hrs at 250,000 ppm
Carbon-monoxide	100 ppm	Odorless	200 ppm, headaches in 2-3 hrs; 1600 ppm, nausea in 20 min; unconsciousness, death in 10-15 min at 6400 ppm
Diborane	2 ppm		Threshold limit, 0.1 ppm; 2 ppm, pulmonary damage; lethal dose, 50 ppm for 4 hrs
Ethanol	1000 ppm	Alcohol	Eye, lung irritations; intoxication
Furfuryl		Almondlike	Central nervous system attack
Gasoline	500-1000 ppm	Petroleum	Asphixiant
Hydrazine	5 ppm	Ammonia	Delayed severe irritant; burns, lung, liver, kidney damage.
Hydrogen		Odorless	Nontoxic; fire-hazard
Methanol	200 ppm	Alcohol	Central nervous system, optic nerve attack; blindness
JP	1000 ppm	Petroleum	Intoxication; headache; nausea
Pentaborane	3.3 ppm		Detectable odor, 10 ppm; lethal dose, 18 ppm

Table III: Metals

Metal	Concentration (per cubic meter)		
Beryllium	0.01-2	micrograms	mac
Lead	15	mg	tl
Magnesium	15	mg	mac
Manganese	0.15	mg	tl
Mercury	0.1	mg	tl
Molybdenum	5	mg	tl
Titanium (as Ti0^2)	15	mg	tl
Vanadium	5	mg	tl
Zinc	0.15-0.5	mg	tl
Zirconium	5-15	mg	tl

mac: maximum allowable concentration mg: milligrams tl: threshold limit



STATISTICAL COMMUNICATION TECHNIQUES and SPACE TECHNOLOGY

The transmission of information to the earth from a ballistic missile or a space vehicle presents unusual problems in communications. With severe limitations on equipment size and power, the communication system must operate in the presence of receiver noise and interference from the radio environment, including terrestrial sources and, for longer ranges, sources in space. Statistical communication techniques are valuable tools in achieving reliable communications under these difficult conditions. These techniques, by providing means for coding and decoding information and for determining the amount of information which can be sent, make possible the use of low-strength signals which otherwise could not be sorted out from the background of interference and noise.

The statistical approach is also important in the development of systems with a high degree of immunity to electronic countermeasures. The less regular or predictable the nature of transmitted waveforms, the less likelihood there is that interference will prove effective against the communication system. However, it is necessary to design the system to take maximum advantage of the near-random waveform characteristics.

Future space vehicles inherently will impose greater demands on communication systems. Systems for guidance, tracking, and data transmission through space to the moon or the nearer planets are now real goals in space technology. In the development of such systems, statistical communication techniques can be expected to play a significant role.

At Space Technology Laboratories, both experimental and analytical work are proceeding in the application of statistical techniques to the problems of space vehicle electronics. This work illustrates the advanced research and development activities in STL's Electronics Laboratory and the emphasis upon the application of new techniques to the requirements of space technology.

Both in support of its over-all systems engineering responsibility for the Air Force Ballistic Missile programs, and in anticipation of future system requirements, STL is engaged in a wide variety of research and experimental effort. Projects are in progress in aerodynamics, propulsion, structures, and electronics.

The scope of activity at Space Technology Laboratories requires a staff of unusual technical breadth and competence. Inquiries regarding the many opportunities on the Technical Staff are invited.

Operative Altitude Range: *to 70,000 ft.*

Canada's Avro CF-105 Arrow, an all-weather, day-and-night jet fighter, is designed for supersonic missions. Armed with air-to-air missiles, its role will be long-range interception in the North American Defense Command.

The Arrow's electronic system, which combines automatic flight, weapon fire control, communication and navigation functions, is specially designed by RCA in the U.S. A vital component in this electronic brain is UAP's Hydraulic and Electronic Cooling System.

At Arrow's supersonic speeds, on the threshold of the "Thermal Thicket," this UAP designed-and-developed cooling system maintains safe operating temperature for Arrow's electronic equipment.

Get complete information on UAP electronic cooling systems . . . or submit your application problem today for UAP design study! Call the nearest UAP Contractual Engineering Office: Burbank, California VI 9-4236; New York, N. Y. MU-7-1283; Dayton, Ohio BA-4-3841; Montreal, Canada Elwood 4131.

Toxicity of High-Energy Fuels Poses Hazards for Handlers

by William H. Schecter*

THE HIGH-ENERGY fuels now being developed for use in missiles and manned aircraft were dramatically emphasized when the Army announced utilization of such fuels to provide additional thrust for the *Jupiter* C vehicle during launching of the *Explorer* satellite.

But the new fuels have an obvious disadvantage: they are toxic, and their combustion products are far from ideal. There is ample evidence that using such fuels for manned craft will present unusual problems for the designer. High-energy fuels are regarded as those with heating values much above those of hydrocarbon fuels. (The most important property of a fuel is the heating value, referred to as btu/lb. For example, boron-based fuels have approximately 7000 more btu's/lb than JP-4.)

• **Which is best?**—A review of the possible types of high-energy chemicals shows that hydrogen, beryllium, lithium and boron compounds are the only ones likely to produce energies significantly superior to hydrocarbon fuels.

Molecular hydrogen could readily be produced, but, since it is normally gaseous, very low temperatures would be required to store it as a liquid and even then the density is too low.

Beryllium is a more likely prospect but it is scarce, extremely and insidiously toxic, and should probably be conserved in the long run for atomic energy applications. Lithium, a similar case except for toxicity, may find use in rocketry, but in conventional aircraft it seems both difficult and extravagant.

Thus, boron is the logical element on which to base fuels. It is available in large, concentrated deposits in the United States and has chemical properties which appear desirable from the chemical-processing point of view. Fortunately, it forms more or less stable liquid compounds with hydrogen, the best chemical fuel.

Modification of the boron-hydrogen molecules by the addition of hydrocarbon groupings gives fuels of the desired physical and chemical properties. As a supplementary benefit the boranes generally have wider ranges of flammability than hydrocarbons and consequently will allow operation of air-breathing engines at higher altitudes.

The boron hydrides have the obvious disadvantage that they are toxic.

• **Development history**—Callery Chemical Co.'s history is important as a case study in handling of these somewhat toxic and highly flammable materials. Callery's safety record is believed to be comparable to the industry as a whole.

Mine Safety Appliances Co. became interested in the possibilities of boron chemistry in 1946 and assigned a small group of its top scientists to investigate the chemistry of some of these compounds. From this research came indications of completely new horizons in the field of chemistry, and Callery was formed as a subsidiary to continue this work.

Charged with developing a high-energy fuel, the research and development staff inaugurated a program that involved subcontracts with 23 universities and 13 private research organizations. As a result of these combined efforts HiCal, a boron-based high-energy fuel, was produced in pilot-plant quantities within four years. Production of tonnage quantities is soon to become a reality with the completion of two new plants currently under construction—one a $38-million plant for the Navy and the other a $4-million company-owned plant.

• **Toxicity research**—It is difficult to discuss the toxicity of boranes in humans, because the incidence of acute toxicity has been low, and clinical observations are negligible. But extensive studies of acute toxicity of boron

---

**Vice President, Operations*
Callery Chemical Co.

compounds have been made on small animals. The mechanism of the action in the body is not known, but in view of chemical activity, as indicated by physical properties and structure, it is easy to predict that the boranes could interfere with biological processes.

The most extensive studies have been made on diborane, which is gaseous at room temperatures. The main effect of breathing this gas seems to be damage to the lungs. Its toxicity has often been compared with phosgene.

• **Exposure limitations**—Experiments have demonstrated that pulmonary damage can be noted if a test animal is exposed at a concentration of about 5 ppm for 6 hours a day, 5 days a week; when the test is run at 2 ppm, similar damage is noted in a somewhat longer time. The American Conference of Governmental Industrial Hygienists (ACGIH) has adopted a maximum allowable concentration for daily exposure of 0.1 ppm. This, however, is not a completely realistic value, since no method has yet been developed which can reliably detect that concentration. Diborane can be detected by odor only to 3 to 4 ppm.

Pentaborane, a volatile liquid; and decaborane, a solid, differ from diborane in that they attack the central nervous system rather than the pulmonary system. Decaborane has also been found to cause damage to the liver and kidneys. Symptoms of exposure to these higher boranes include loss of coordination, convulsions, weakness, tremors and hyperexcitability.

The suggestion has been made that the symptoms are of two types because of differences in chemical reactivity of the boranes. Diborane is taken into the lungs, where it reacts rapidly with moisture and can cause immediate damage. Decaborane and pentaborane react with water much more slowly than does diborane, so they concentrate in fats and liquids and have a more pronounced effect on the central nervous system.

Repeated 5-hour daily exposures to 3.3 ppm pentaborane causes death in test animals. Pentaborane and decaborane are more toxic than diborane maximum allowable concentrations (MAC's) so the MAC's have been set at 0.01 and 0.05 ppm, respectively. Although pentaborane is toxic in lower concentrations than decaborane, the rate of recovery of rats from decaborane exposure is always slower.

The median detectable concentration by odor for man is 2.5 ppm for pentaborane and 0.35 ppm for decaborane. Pentaborane is said to smell like garlic or acetylene, and decaborane has an unpleasant or foul odor. Rapid olfactory fatigue adds to the hazard of depending only on the sense of smell.

Even the little work that has been done on boron high-energy fuel components demonstrates that they have an order of toxicity between that of pentaborane and of decaborane. HiCal component A, which is a major component of HiCal and the one studied most thoroughly, attacks the pulmonary and central nervous systems similarly to decaborane and pentaborane.

A convenient method of comparing the acute toxicity of compounds is the concentration necessary to kill 50 percent of the test animals (LC_{50}).

A more realistic measure of effective toxicity of such compounds is the Hazard Index which is a function of both toxicity and vapor pressure. Using this index, decaborane and HiCal component A are no more hazardous than many common chemicals such as carbon tetrachloride, benzene and hydrazine. This, of course, is due to low vapor pressure at room temperature.

• **Detectors needed**—The detection of low concentrations of boranes has been a most serious problem as has analytical work in general in the boron field. All of the modern analytical tools have been utilized on this problem: mass spectrometry, infrared and ultraviolet spectrometry, and chromatography, as well as the techniques of radiochemistry.

In spite of all this analytical development effort there are still no commercial borane detectors on the market at present, but Mine Safety Appliances has two types of monitoring devices under development. One is a small, hand-operated device which is sensitive to pentaborane to about 0.4 ppm. This instrument is very useful in detecting leaks and rechecking a location after a spill.

The other instrument shows great promise: it measures the concentrations of boranes electrically and is expected to determine concentrations below 0.1 ppm, probably as low as 0.01 ppm.

• **Safety measures**—Callery's safety record in the last two years is comparable to the petroleum industry in frequency—and is very much lower in severity than any of the process industries. This record has shown steady improvement as personnel have gained experience and further developed engineering techniques in this new commercial field.

In general, safety results from avoiding inhalation, skin contact or ingestion of any borane material.

Laboratory investigations are usually carried out in fume hoods, where the air is changed at the rate of five to ten times a minute. The laboratories are maintained at a positive pressure with an auxiliary heater-blower which supplies warm outside air.

Because of chemical reactivity as well as toxicity, experiments are carried out in an all-glass, vacuum-lined system whenever possible. This technique was developed primarily for use in the boron-hydride field and has the added advantage of giving accurate results using only small quantities of reactants. Equipment such as dry boxes are also used to combat the reactivity of the chemicals and to protect research personnel.

Because of the reactivity of various of the fuel intermediates, all equipment, whether in the laboratory, pilot plants or production units, is carefully flushed with nitrogen prior to use in order to remove water and thus insure safe operation. In setting up engineering scale research equipment, quarter-inch steel plate is used both as protection for the operators and as a panelboard. This, in connection with a "soft" wall on one side of the steel-walled rooms, has served very well for the last several years.

In addition each one of these rooms is exhausted by its own blower, and air entering the building is tempered and used to pressurize the experimental units.

In full-scale operations, the same basic rules are followed to give safe operating conditions: the buildings are adequately ventilated and much of the construction is of the outdoor type, thus reducing toxic exposure.

• **Boron uses**—Recent intense research has created great interest in boron chemicals. As of now the largest "new" use of boron compounds is as high-energy fuels. Many of the new compounds have unique chemical properties, and it is inevitable that they will find many chemical uses.

One of the most notable commercial chemical properties of boranes is their reducing ability. Most commercial reducing agents, although rather cheap, are not particularly selective. The boranes, though, are quite selective.

Various boron compounds have had application in such diverse areas as polymerization catalysts, fuel additives, bacteriocides and fungicides, and as a welding flux. It is possible to protect the more active metals with a film of unreactive metal boride including some of these compounds. Methyl borate is a nonaqueous solvent which could improve certain reactions.

One of the most recent applications of a boron compound is the use of trimethoxyboroxine to control titanium, zirconium and magnesium fires.★

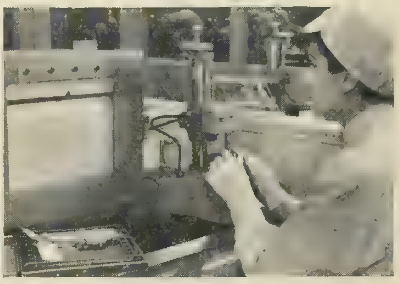
FACTS

BRIGHT PATH OF PRECISION!

Every stage of a missile's flight from take-off to target is marked by the necessity for a degree of accuracy in its controlling parts far greater than required in any previous instrumentation.

That bright path of success written in the skies by missiles of various kinds is visible evidence of the extreme precision built into the New Departure ball bearings used in the gyroscopes, servos and other vital elements of the guidance systems.

New Departure takes great pride in its ability to meet the exacting specifications of the products for the Army, Navy and Air Force programs.



Comparator measures dimensions to one-millionth of an inch. One of many pieces of ultra-precision equipment in the New Departure bearing laboratories.

In many bearings, various dimensions and surface finishes must be held to within tolerances of a few millionths of an inch.

J. Sentovic

How to Travel Outside Our Solar System

by Franco Fiorio*

IN THE ERA of ballistic missiles and satellite launching, the voice of an old master in the field of astronautical sciences reaches us from Rome, Italy, to tell of new approaches to solve the future problems of "cosmonautics."

The scientist is Prof. Gaetano Crocco, president of the Italian Rocket Society, and of the new Italian Ballistic Information Center, and father of Princeton's famed Dr. Gino Crocco. His ideas appeared in an article written in the Italian magazine, CIVILTA DELLE MACCHINE.

Prof. Crocco agrees with Dr. H. Strughold that in our solar "echosphere" there aren't many hopes of finding a suitable planet for the human race, which, under the mounting pressure of an ever-increasing population, will be forced to seek escape from the earth within a few generations.

This forecast brings about the need to know much more about both the planets of our solar system and other fixed star systems than is possible through astronomical observation tools (telescopes, spectrometers and the like).

Comparing the astronomer with Galileo and the astronaut with Columbus, Prof. Crocco points out that Galileo's theoretical findings that the earth is round, would never have been confirmed without Columbus'.

Similarly, man won't be able to plan an intelligent space travel program without a preliminary exploration by a few dedicated pioneers, who will evaluate, at close range, the possibilities of life for human on other worlds.

An important question: How far from the earth will man be able to travel and return, within the span of human life? To find an answer, Prof. Crocco has followed the same line of thought as Dr. Saenger, Dr. Ackeret and Dr. E. H. Krause in seeking an application of relativistic theory to applied cosmonautics.

First of all, to be able to reach cosmic distances, man has to learn how to fly his vehicles at cosmic speeds—very close to the speed of light. This means a new propulsion system with a specific impulse of some 30-million seconds.

Compare this astonishing figure with the 300 seconds of today's best chemical propellants and with the approximately one million seconds possible from nuclear rockets.

- **Cosmic jet stream**—However, the existence of cosmic rays, a sort of "jet stream" of particles of matter coming from the unknown depths of the universe and traveling at speeds very close to that of light, opens up many new possibilities for greater speeds.

Scientists all over the world have had considerable success in reproducing these speeds in giant accelerators.

- **Space propulsion**—Chemical propellants, even with high energy fuels and free radicals, are not suited for space propulsion. They lack the necessary energy; nuclear jet propulsion is the only possibility for substained interplanetary travel.

On this subject scientists have measured the thermic jet against the ion jet. According to a theory developed in Britain by Dr. L. R. Shepherd and A. N. Cleaver, Prof. Crocco has worked out—for a specific practical speed of interplanetary travel and for standard pressures in the combustion chambers—the following relationship between temperature and voltage needed:

$$1^\circ \text{ Kelvin} \cong 5000 \text{ Volts}$$

In other words, while a temperature of 1,800,000° K. would be needed for a "practical" speed of 190 miles

---

* *Dr. Fiorio is United States liaison chief for the Italian Aeronautical and Nucleonic Center, with his headquarters in Washington, D.C.*

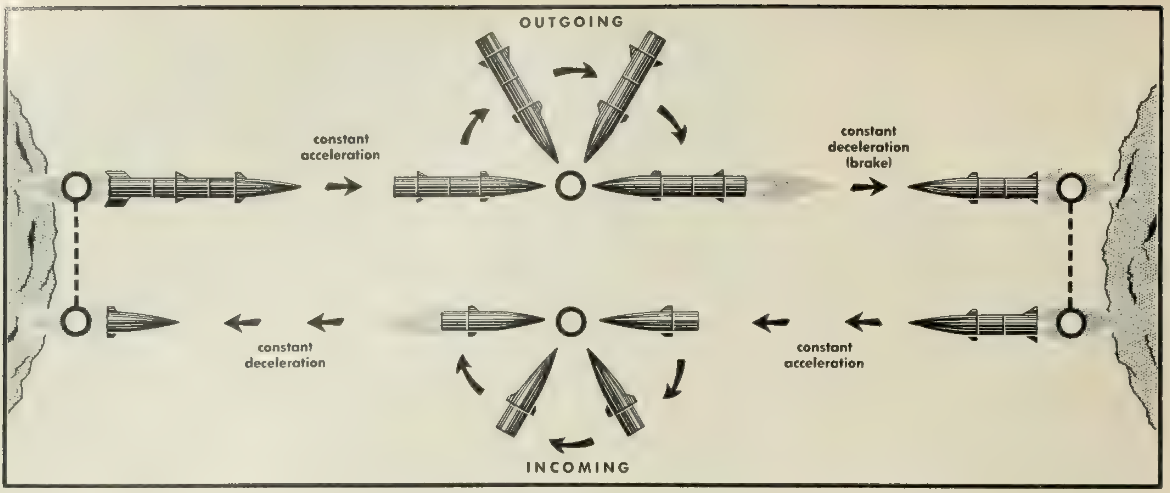

FIG. 1—FOUR STEP cosmonautic trip envisages reversal of vehicle, both on outgoing and returning trip.

per second, with a molecular weight of the jet exhaust of 2, the same result can be obtained with only 360 volts. The ion jet wins the contest easily.

An ion propulsion system might consist of an ion accelerator unit, powered by nuclear fission energy. At today's efficiency ratio of nuclear reactors, such an arrangement might reach a speed on the order of magnitude of 1/25 the speed of light.

The design and construction of a spaceship embodying these principles is perfectly feasible.

• **Not enough?**—But nuclear power at the efficiency ratio of today, with a top attainable speed of 1/25 of the speed of light—excellent for travel in our own solar system—is not good enough for travel to other solar systems or galaxies.

For this purpose Dr. Saenger visualizes photon rockets utilizing "radiation pressure" of "radiation quanta" with mass zero. Prof. Crocco disagrees with Saenger's proposal; he believes that "radiation pressure" is technically unsuited to cosmonautic propulsion due to the excessive dimensions of the radiators involved and very high operating temperatures.

He is convinced that a higher energy source is already available in matter itself—if and when human ingenuity can draw from the atom the full amount of energy available according to Einstein's equations, and convert it fully to propulsion power. It will be possible then to reach speeds quasi-equal to the speed of sound.

Both Saenger and Crocco are taking for granted that the development of either the photon rocket or the integral extraction of energy from the atom will take place.

• **Testing a cosmo-ship**—It is immediately apparent that it would be impossible to apply existing aeronautical or ballistic testing techniques to an experimental model of such a ship.

In fact, the only conventional way to test the ship close to the earth would be to curve its trajectory around our globe by a magnetic platform, using techniques similar to those in nuclear accelerators.

But the forces involved are out of the realm of practical possibilities: i.e., for a speed of 96 percent the speed of light, even ignoring the relativity effect, a force of 1300 tons would be needed for every gram of circulating matter. Adding relativity effect, this force becomes 500 tons.

This means that trajectories of bodies at relativistic speeds, are pretty much "inflexible" and cannot be deviated practically from a straight line.

The result is that for travel at relativistic speeds, only straight trajectories with the maneuvering possibilities limited to acceleration and deceleration, starts and stops can be considered.

A round trip to a target in outer space can therefore be planned either as a four or a six-step trajectory as shown in Figs. 1 and 2.

Fig. 1 shows the four-step trip: outgoing (constant accelerations and constant deceleration), and incoming (constant acceleration and constant deceleration) with inversion of the ship at the halfway point.

Fig. 2 is the six-step trip, with a constant speed phase inserted between acceleration and deceleration periods.

The speed of the cosmo-ship along the straight trajectory, up to approximately one-fifth the speed of light, can be computed by the laws of conventional astronautics:

$$B = \frac{v}{c} = \log \frac{Mo}{M} = \log R \quad (1)$$

where v is the speed of the cosmo-ship, *c* is the speed of the jet exhaust that we assumed "almost" equal to the speed of light, Mo the total mass at takeoff and M the mass at the time.

At speeds higher than one-fifth the speed of light, the conventional formula is no longer valid and Prof. Crocco presents this relativistic expression, valid in the vacuum and in the absence of gravitational forces:

$$B = \frac{v}{c} = \frac{R^2 - 1}{R^2 + 1}$$

The difference between the two regimes of speed are illustrated in Fig. 3, where it is clearly shown that how the conventional formula is no longer valid for high value of $R = \frac{Mo}{M}$ and is substituted by the relativistic expression by which the speed of the cosmo-ship increases asimtotically toward the speed of light, never reaching it: i.e., with B never reaching the value of 1.

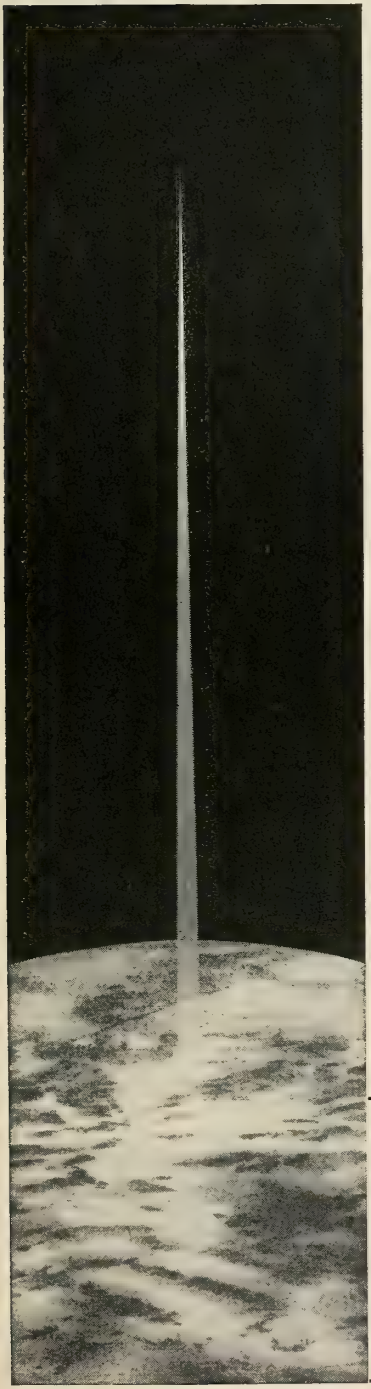
• **Operation of the cosmo-ship**—The pilot of the cosmo-ship has what seems to be a very simple task:

If he adopts the four-steps flying plan he must accelerate the ship from zero to a maximum speed, halfway to his target. At this point he has to "reverse" the ship and start decelerating, to a stop on the chosen body.

The determination of maximum speed and of the halfway distance could be a very knotty problem—but there is a solution: if the rate of acceleration is kept equal to the rate of deceleration, (both of them kept constant by a special mass regulator)

Engineers: Act NOW to move your career years ahead, with the company building the power plants for

ATLAS · THOR · JUPITER · REDSTONE



Even as you read this, ROCKETDYNE is testing the mighty propulsion systems to launch the major missiles of the Free World. There's a unique excitement in the work. It marks a turning point in history. Man is beginning to conquer space.

POWER—AND STILL MORE POWER

At ROCKETDYNE's 1600-acre Propulsion Field Lab. near Los Angeles, and in the new test stands at the Neosho plant in Missouri, the thrust ratings make previous engine development look puny by comparison. And still the demand is for even more power—power that gulps hundredweights of fuel per second—power that must be controlled with the delicate accuracy of a high precision instrument.

NEW WORLD OF ENGINEERING

This is a major new industry. The men who run it are professionals of an entirely new breed. Among them are mechanical and chemical engineers, physicists, dynamics specialists, creators of control systems of all kinds, heat exchange experts, research men, test engineers capable of handling the mightiest engines ever built. Every day two miles of data tape come from the test stands to teach them something new. If the state of their art could be put into print right now, the book would be out of date in a week.

At ROCKETDYNE you'll work with methods and techniques years ahead of conventional industry. You'll be a fully informed partner in major projects. Your advancement will be limited only by your own ability, and our educational refund plan can step up your qualifications for positions right at the top.

YOUR CAREER CAN GROW FAST IN THIS FAST-GROWING FIELD

NORMAN C. REUEL received his BS in Chem. E. at Georgia Tech. and an MSAE at Cal. Tech. specializing in jet propulsion. Following rocket and radar development in the Navy he joined North American Aviation in 1946 as a research engineer. Now assistant chief of design and development, he also finds time to relax at his ranch home, bowl, golf, and play tournament bridge.

PAUL D. CASTENHOLZ, Pacific combat veteran, graduated B.Sc. (Eng.), UCLA 1949. From research engineer his grasp of rocket engine work raised him through a supervisory post in experimental development to assistant group leader in combustion devices, and then to group leader of experimental engines. Recently completed requirements for his MSc. Relaxes with hi-fi, fishing and back packing.

TITANIUM ON TOP

in medium-high temperature range

Today's most popular titanium alloy, MST 6Al-4V, excels all other metals in strength to density ratio through 900°F. At room temperature, considering only strength, a part made of this alloy need have only 60% of the weight of the equivalent part in stainless steel.

Performance for extended times at elevated temperatures is likewise good. In typical creep tests, with 1% permanent deformation allowed, MST 6Al-4V alloy shows 100,000 psi allowable stress at 750°F for 1 hour; 77,000 psi at 100 hours; 65,000 psi at 1000 hours.

Meanwhile new alloys extending the elevated temperature usefulness of titanium—to as high as 1000°F—are now emerging from the laboratory into production.

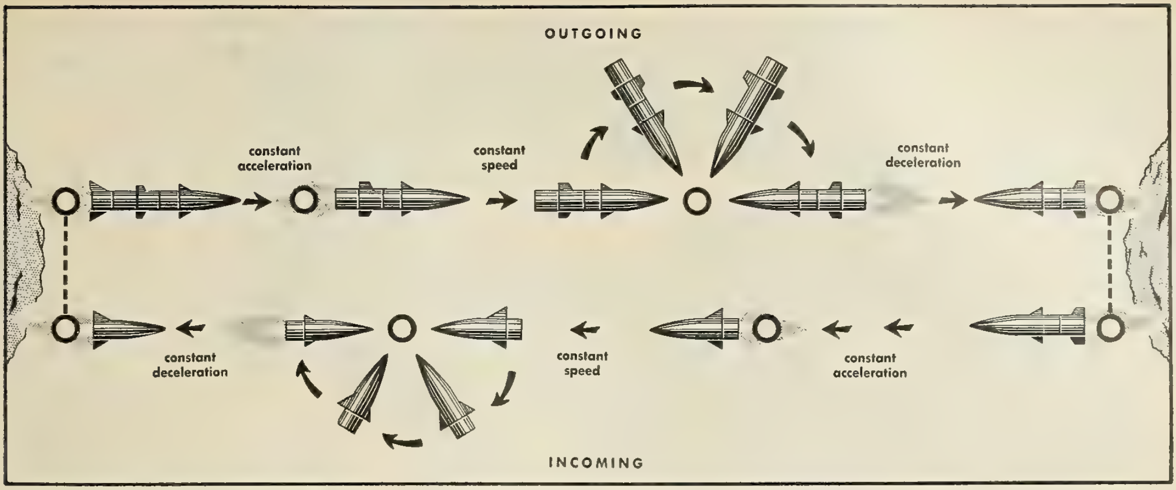

FIG. 2—SIX-STEP cosmonautic trip adds work for pilot, calls for careful reading of instrumentation.

the formula (1) and (2) supply a way to determine speed and distance through the measurement of $\frac{Mo}{M} = R$, i.e., the consumption of nuclear fuel.

Of course, the assumption is valid only for motion in a vacuum and in the absence of gravitational forces. Therefore, it applies only to cosmic travel, and not to interplanetary flight within our solar system.

Measurements taken inside the cosmo-ship will check with the ones taken on earth for only a short time: until the ship reaches one-fifth the speed of light.

If the pilot chooses a constant acceleration of 9.5 meters/sec²—very close to g—the identity between ship and earth measurements is valid only for the distance of 32 times the radius of the solar system. The pilot can thus determine the moment he reaches a relativistic speed by checking his fuel consumption, which would indicate an $R = 1.2214$, equivalent to 73 days of flight.

From then on, the pilot flies at relativistic speeds and the advantage of the relationship between speed and consumption comes into play: the pilot doesn't have to worry about relativistic time and acceleration; all he has to do is to keep a close check on constant acceleration as indicated by his ship-borne instruments and to measure his fuel consumption, to determine exactly when he has to "reverse" the ship the distance covered and the exact speed of the ship.

In the case of a constant acceleration and deceleration of 9.5 m/sec² the crew should also be in good physiological condition, since the whole trip would be made at a personal weight very close to weight on earth.

In this case, the relativistic relationship between fuel consumption and the distance n measured in light-years, according to Prof. Crocco is:

$$n = \frac{(R-1)^2}{2R}$$

Though the pilot doesn't have to worry about computation of the elapsed time doesn't mean that time has no importance for the crew. Both astronomical time—terrestrial time—and the relativistic time are important, because they affect the very life of the travelers.

As Saenger, Krause, Ackeret and many others have already pointed out, relativistic "dilation" affects the crew's time, making it shorter than terrestrial. The Crocco equations, establishing the relationship between terrestrial time T, relativistic (crew's) time Te and distance covered n (in light-years) are:

$$ATe = \log R$$

$$\frac{T}{T_e} = \frac{R^2-1}{2R \log R} \qquad n = \frac{(R-1)^2}{2R \log R}$$

where: R has the usual significance and A is a coefficient function of the ship's acceleration becoming equal-l for an acceleration of 9.5 meters/sec.² A very quick calculation shows that, for A-1, and R-10, an elapsed time of 4.5 terrestrial years is equivalent to only 2.3 years of the crew's life and is sufficient to travel a distance of 4.05 light-years.

In other words, under those particular conditions, the crew has the illusion of traveling at almost twice the speed of light.

• **Limits of Cosmonautic travel**—Two important factors in future cosmonautic travels will be the fuel consumption characteristics of the propulsion system and the physiological length of the human life.

Starting from the assumption of a cosmo-ship with a total weight/payload (including fuel) ratio of 1300, i.e., of the order of magnitude of today's artificial satellites, and accepting the "optimum" conditions outlined before (as the full exploitation of the energy of the atoms: a vehicle speed "quasi" equal to the speed of light, etc.), Prof. Crocco comes to the conclusion that, for a four-step constant acceleration round trip (Fig. 2) in space, a practical limiting distance might be 16 light-years.

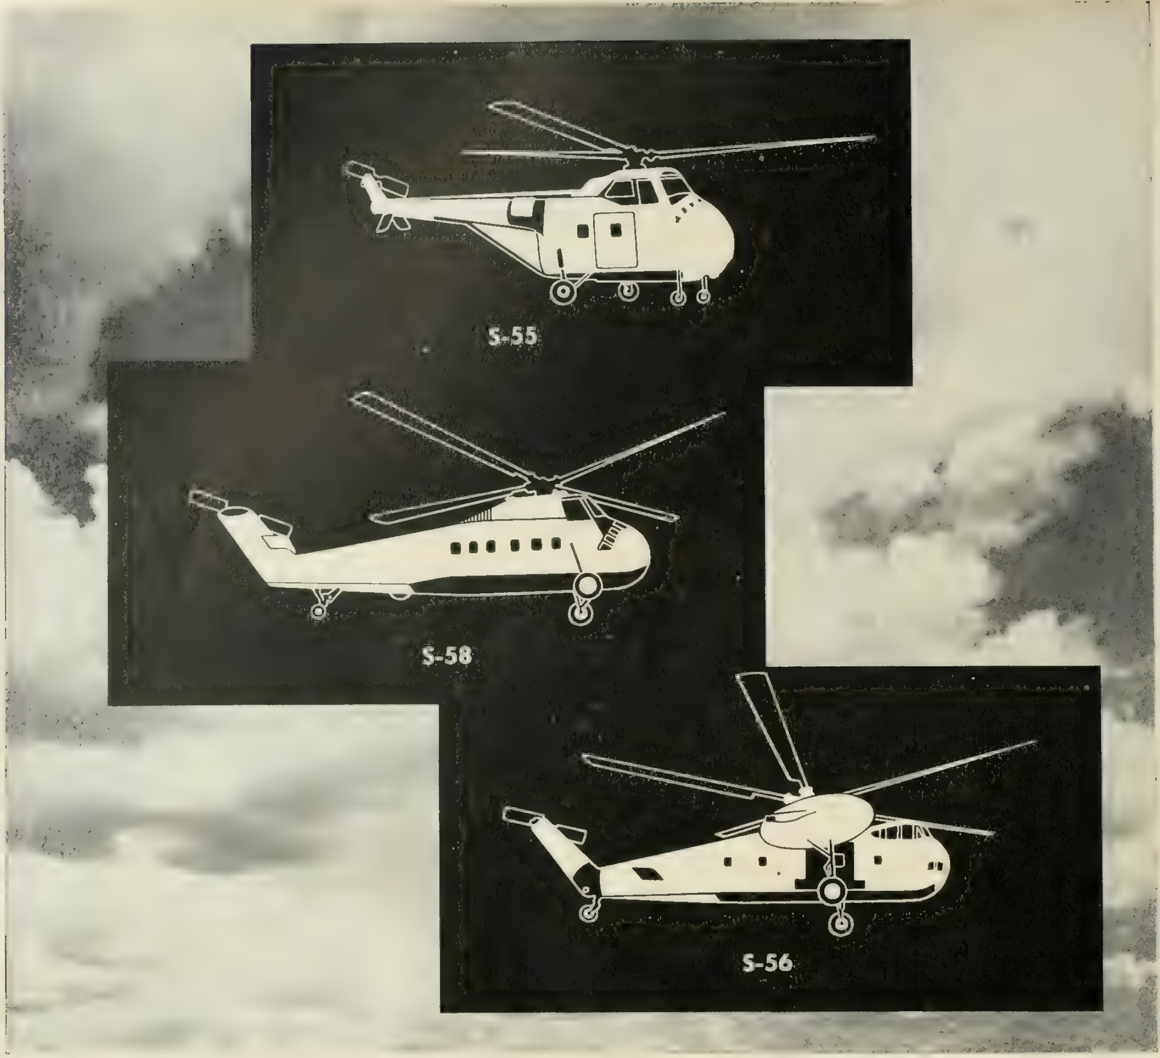
It would take almost 30 years of life for a roundtrip of that kind, which could reach the star, Altair, and approximately 50 other stars within the same radius from the earth.

If, instead of the convenient four-step, constant acceleration scheme, the more sophisticated, six-step (Fig. 2) scheme is adopted, the advantage of using only the fuel consumption as a distance and speed gauge is lost, and for the stretch traveled at constant speed, the accurate measurement of the relativity time is also mandatory.

On the other hand, for the six-step scheme Prof. Crocco is able to demonstrate that the limiting distance for equal values of Ie and R is almost double that in the four-step scheme.

It therefore would be possible to reach the distance within a sphere of a 34-light-year radius, containing approximately 480 fixed stars.

These by no means are the limits of man's ultimate frontiers in the exploration of space. Some day it will be possible to devise a way to utilize as fuel the energy of fragments of matter existing in space. In this case the frontiers of the universe could be pushed even farther away and an increasing number of new stars would fall within reach of the human race.★



white areas show extensive use of magnesium

MAGNESIUM ALLOYS BUILD BIGGER PAYLOADS INTO SIKORSKY 'COPTERS

Structural dead weight—that ever critical problem in the design of air frames and missiles—is a problem Sikorsky Aircraft solved several years ago.

As every helicopter designer well knows, everything below the rotor is sheer dead weight and contributes nothing to lifting the aircraft. So it's no wonder Sikorsky uses magnesium alloys where they can. This lightest of all structural metals weighs only 65% as much as aluminum. Easy to see how the use of magnesium adds substantially to the payload—by subtracting weight from the structural load.

The S-56, Sikorsky's largest 'copter to date, carries a total of 5,558 lbs. of magnesium. This total includes the wheels, almost the entire skin and numerous other components. Several highly stressed areas, such as the rotor hub plates, are magnesium forgings. Other Sikorsky models, such as the S-58 and S-55, famous Korean War 'copter, also use magnesium alloys to good advantage.

For more information about magnesium, contact your nearest Dow Sales Office or write THE DOW CHEMICAL COMPANY, Midland, Michigan, Department MA 1402L.

Recoverable Boosters Are Studied to Cut Manned Space Flight Cost

by D. C. Romick, R. A. Belfiglio and F. B. Sandgren*

WITHIN A RELATIVELY short time, manned space flight can be expected to assume large-scale proportions. In anticipation of this, the concept known as *Meteor*[1,2,3] employing manned recoverable boosters, has been analyzed and studied under sponsorship of Goodyear Aircraft Corp. (m/r, March, p. 134).

The basic assumption implicit in the idea of manned space flight is that it will be possible to obtain satisfactory re-entry and control of the final stage. *Meteor* extends the principle of reentry and control to the manned booster phases as well as to the final stage, reducing the cost of the launch to the expenditure of fuel without simultaneously destroying the expensive booster hardware.

Primary objective in the *Meteor* concept is reduction in cost of manned space-flight operations. Other benefits include freedom of selection of launch site, and choice of orbit without danger that expended boosters will fall into inappropriate areas.

Manned space flight in the immediate future will utilize existing nonrecoverable booster hardware. A practical necessity, it is economically feasible because of the comparatively few flights involved. But long-range operational requirements of manned space flight will involve continuous operation of reconnaissance patrols, communicacations relay systems, and establishment of a satellite space station for lunar and interplanetary probes.

The number of flights required for these operations will make the costs of expendable boosters prohibitive. It appears inevitable, then, that some method should be devised to recover the expensive booster stages of any space-flight system, even though added initial investments and effort will be required. The *Meteor* concept is designed to take advantage of these possible long-range economies.

- **Vehicle for recovery**—In the concept of *Meteor,* a three-stage vehicle is employed. The first and second stages—after separation—glide to auxiliary bases where they are fitted with turbojet engine pods and tail fairings, so that they can be flown back to the launching base for reuse. The final stage is also a winged glide vehicle, which on re-entry, returns to the launching base.

A variety of third-stage vehicle configurations or loadings may be employed, depending upon the mission. The final stage is big enough to be used for reconnaissance, bombing, interception, or satellite ferry missions. The same first and second stages and the auxiliary subsystems can, therefore, be utilized for all missions.

- **How many needed?**—In order to establish a basis for comparison, the magnitude of future operational uses was first determined, then an operational schedule was used to estimate the number of vehicles involved, and the cost of the operational system was calculated. This cost analysis is based on using *Meteor Jr,* a minimum-sized ferry rocket vehicle.

An aggregate of projected requirements for various possible missions have been plotted in Fig. 1, on the basis of the daily number of flights. Military demands include reconnaissance, bombardment, interception, and building and supporting a space station. Non-military demands include scientific research, meteorology, astronomy, and communication relay—all on an individual basis, with a view toward eventual establishment of a space platform for various public services and scientific functions. Such platforms can be expected to serve both military and nonmilitary missions, to support extraorbital ferry flights.

The abrupt reduction in the slopes of the upper total curve anticipates the introduction of newer models with greater carrying capacity. In general, the utilization curve of any one model resembles a normal distribution curve.

The number of vehicles required to satisfy the demands of the missions outlined depends on the number of flights each vehicle can supply. This, in turn, is determined both by the total number of flights of which the vehicle is capable, and availability by scheduling.

The total flight capability depends on the operational design life of the vehicle, the operational attrition and the operational life span in years. As for any manned aircraft, the design life of the vehicle cannot be a limiting factor. The incidence of "washout" type accidents was estimated by analysis of data on current military operations, discussions with pilots about comparative flight characteristics, and reliability studies of the takeoff phase.

Goodyear

From this analysis an attrition rate was assumed to be one per 1000 flights per vehicle. From consideration of the life span of military models, an operational life span of 100 years was assumed; this was consistent with the projected operational flight requirements shown in FIG. 2.

Schedule availability is dependent on the operational turn-around time of the vehicle system. Analytical consideration was given to the time required for each separate operation. The first stage required 29 hours; second stage 33 hours, and the final stage 29 to 49 hours, depending on the mission. From these values the average number of yearly flights per vehicle was determined to be 250.

Based on this availability, the maximum number of vehicles required at the peak demand for a particular model, plus the attrition to that date, determined the total number of vehicles required. The attrition rate does not reduce the number of vehicles required below the demand curve for the usage of a particular model as it is superseded by advanced design; the

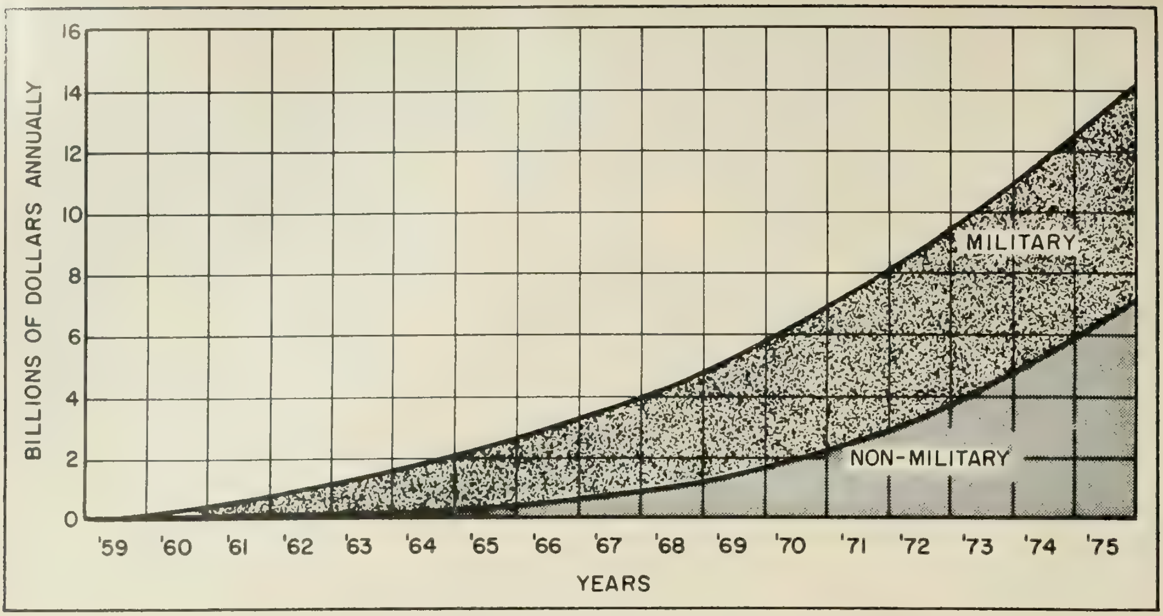

FIG. 1—Projected total costs of *Meteor Jr.*, for two probable uses.

number required at the aforementioned peak of demand, therefore, has been entered in Table 1. The longer turnaround time of the third stage resulted in doubling the requirements for this stage.

• **Figuring costs**—Having established the number of vehicles required, it was now possible to estimate the cost of the system. Cost per vehicle was obtained by application of typical bomber costs.

This technique appears reasonable; the empty weight of stage 1 is less than a B-52, the empty weight of the stage 2 vehicle is less than a B-57 or a B-45, and the overall complexity of these stages does not seem significantly greater than that of modern bombers. Progress curves were plotted for manpower, material and rocket-motor costs in order to achieve reasonable production costs. In production, *Meteor Jr* costs per pound for the booster-stage vehicles should approximate bomber production costs.

To determine overall system costs, data previously discussed was compiled to form Table 1, which represents the elements of cost involved for various mission characteristics, which are indicated by the values in the first three columns, and are similar to those used to derive the curves of Fig. 2.

For example, the fifth entry below the dashed cross-over line on Table 1

Table 1: Comparative System Operation Cost (Meteor vs. Expendable Booster)

	Mission Characteristics			No. and Cost of Recoverable Vehicles					Total system		Cost flight

(*000 omitted)

The operations as listed could serve as follows:

Line 1. Scientific missions (astronomy, space biology, electronic and chemical research, etc).
Line 2. Same, over longer period of time, expanding capability.
Line 3. Limited reconnaissance mission, as well as scientific.
Line 4. More extensive reconnaissance capability, and/or limited interception and patrol mission.
Line 5. Same as line 4, but greater capability.
Line 6. Intercept missions, or building and supplying a small satellite space station.
Line 7. Good-sized station-building mission, though at a slow expansion rate.
Line 8. Station building mission, combined with other above listed missions.
Line 9. Combined missions somewhat corresponding to those shown in Fig. 2.
Line 10. Extensive combined mission capability.
Line 11. Special high-density bombing mission capability.

reliability

At Hughes the Systems Engineering approach is considered essential for optimum reliability. The basic design of complex electronic systems is relatively more advanced than the Reliability Engineering which will ensure their successful operation.

Thus, the challenge of the reliability barrier now requires the optimum application of creative engineering.

Several openings for both senior and junior engineers—preferably with radar systems, missiles, or communications backgrounds—now exist in these areas of reliability: Prediction, Design Review, Analysis, Promotion. Your inquiry is invited. Please write Mr. J. C. Bailey at the address below.

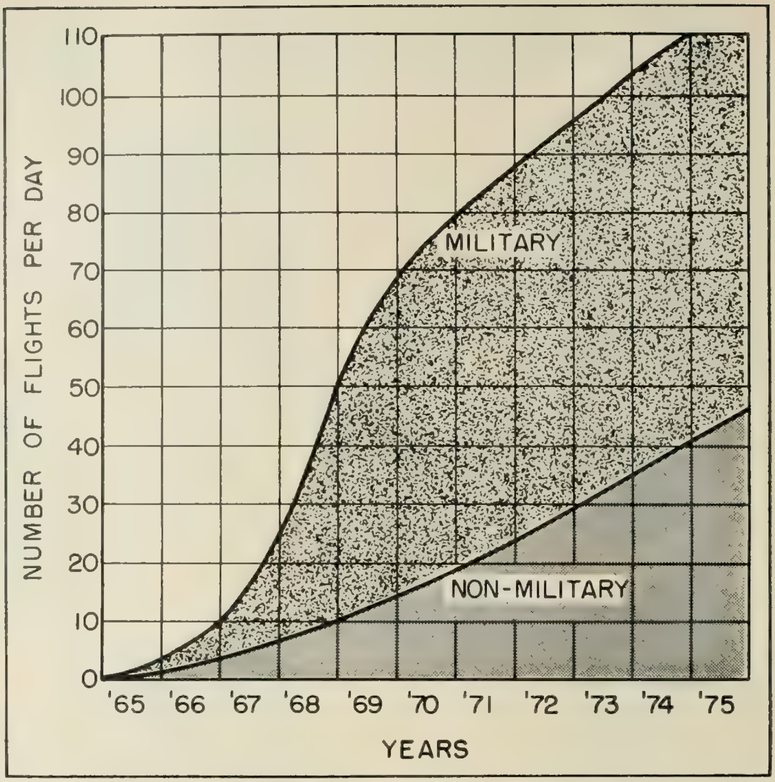

FIG. 2—Projected operational flight requirements for missile system employing with either recoverable or expendable boosters.

assumes 10,000 flights over a ten-year period with an average peak rate of 5½ flights per day.

To accomplish this, 14 pairs of recoverable booster-stage vehicles and 27 final-stage vehicles are required, costing a total of $231 million. After adding the corresponding operational costs, the total system cost using recoverable boosters is $2.31 billion. For the same number of flights, the total system cost using expendable boosters is about $13 billion. This yields an average cost of $231,000 per flight for *Meteor Jr* recoverable boosters, compared to $1.3 million per flight using expendable boosters for this size operation.

The ratio of expendable booster systems to *Meteor Jr* system cost is, therefore, about 5½ to 1, and becomes more favorable as the number of required flights increases. It appears that the cross-over point is around 100 flights. If total flight requirements are less than 100 flights, the cost ratio will probably favor the expendable boosters.

It is possible, however, that flight flexibility of the booster stages of *Meteor Jr* may facilitate development testing to a point where cost cross-over is reduced to considerably less than 100 flights. At any rate, this analysis shows that for more than 1000 total operational flights the economic superiority for the recoverable booster feature continues to increase.

From the information thus obtained it becomes possible to project corresponding total cost for a *Meteor Jr* system operation of the extent indicated in Fig. 2. This projection is presented in Fig. 1.

The projected total costs on Fig. 1 start rather modestly in the early '60s and reach a peak of $14 billion annually in 1975, when projected daily flights into orbit exceed a rate of 100 per day. The costs reflected in FIG. 1 are all overall, including development, procurement, and operational and maintenance costs.

This program appears economically feasible if compared with long-range predictions in our Gross National Product (GNP), National Budget, and Defense Department budget. The division of costs between military and nonmilitary agencies could have a "checks and balances" effect upon integrated program activities and tend to hold costs to within reasonable proportions.

The above analysis shows that, while such orbital operations will be expensive (as have all new systems of higher performance), they need not

THOMAS A.

EDISON

missile control system sets new standards in miniaturization and performance

Designed and developed by Edison in record-breaking time, this subminiature control system does a full-size job in helping to steer one of the country's newest missiles.

Subminiature systems work of this kind has been conducted at Edison for a long time. The many facilities of the company work together, complement each other . . . add up to unmatched electronic systems capability.

The above photo illustrates a system that contains a mixer circuit, pre-amplifier, magnetic amplifier, servo motor, close tolerance gear train and control transformer, all of which, when hermetically packaged, weigh only 9.5 ounces.

Systems responsibility assignments have helped shape the structure of Edison. Servos, servo systems, magnetic amplifiers, computers, transducers, precision gear trains and miniature relays — the building blocks of missile electronics — are all designed, developed and produced at Edison. All products are backed by field service facilities staffed with experienced engineers.

Edison research facilities are among the best in the country. Engineers and scientists can call on analog computers, on fully equipped chemical and electronic laboratories.

For remote control circuits — for all types of electronic systems and subsystems, write to:

Although created over ten years ago, the Defense Department has never been the subject of a complete coverage of its organizational structure and key personnel. The new *Defense Department Reference Guide* fills this need by furnishing a unified, closely-written presentation of America's over-all defense establishment.

It is divided in four parts: the Office of the Secretary of Defense, the Department of the Army, the Department of the Navy, and the Department of the Air Force. It provides significant background material, functional summaries, organization charts, outlines of the basic concepts underlying each department, and other essential data.

Defense Department Reference Guide is an authentic 140-page report, specially prepared by the staff of Armed Forces Management magazine. To place your order, merely fill-out and mail the coupon below.

be excessively out of good proportion.

Furthermore, it is believed that the *Meteor Jr* recoverable booster system enjoys a marked economic superiority over an expendable booster system. This economic superiority ranges from 1/3 to 1/10 the cost of the expendable booster system, depending on the nature of the missions and the total number of flights required.★

NEW! BENDIX CANISTERED INVERTERS

Withstand the Effects of Temperature, Vibration and Acceleration at Blast-off and Will Function Perfectly at Any Altitude, Including Outer Space

Bendix Canistered Inverters, environment-free and completely sealed, are now in production for the Atlas and Thor missiles. Designed for dependable and efficient operation, Bendix Canistered Inverters are completely sealed against the effects of altitude and can withstand conditions from sea level to outer space.

Cooling techniques employed enable these units to provide full-rated output throughout the flight without external cooling. Both voltage and frequency regulation are accomplished by static, magnetic amplifier-type regulators. Since these regulators have no moving parts, output voltage and frequency are not affected by vibration and shock. The total harmonic content of the output voltage per phase is less than 5%.

Bendix Canistered Inverters are the product of years of development and experience in manufacturing electrical power equipment for aircraft and missiles. They are engineered to meet the strenuous requirements in performance and reliability called for in today's (and tomorrow's) missiles. For more detailed information write to RED BANK DIVISION OF BENDIX AVIATION CORPORATION, EATONTOWN, NEW JERSEY.

Budgeting for the Space Age

Why is it so hard to get good estimates on cost of programs? Here are some answers

by **Seabrook Hull**

A TOP BUDGET OFFICIAL at the Pentagon told m/r recently:

"Before October 4, I could have told you exactly what the defense budget would be in fiscal year 1960 and 1961. Now, I haven't any idea." No one in the Pentagon really knows what even the first space flight projects will be, much less which long-range projects should be picked. Nor will they know, until they have rationalized basic budgeting procedures.

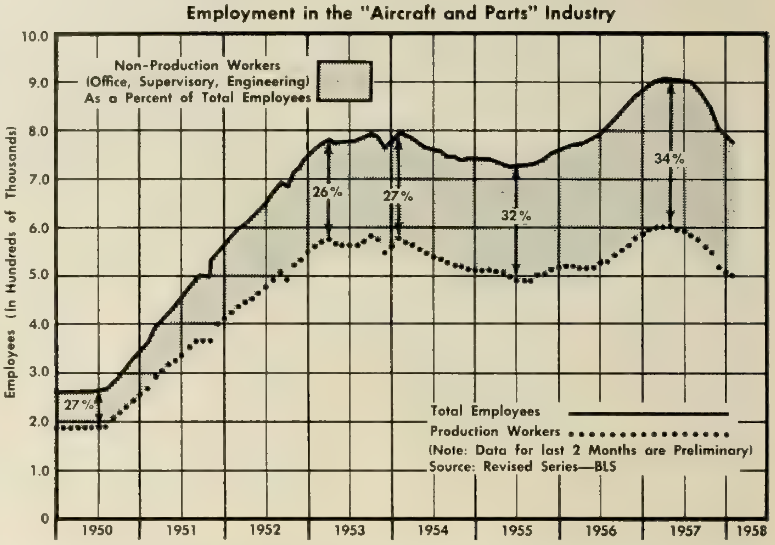
It cost the American taxpayer $700 million "not to get *Navaho*." From the time money was first appropriated in 1951, through 1959 (projected), our big ballistic missile programs (ICBMs, IRBMs, FBMs) will have cost us over $6 billion, not including military pay, etc. This total doesn't include all the massive facilities required for operational deployment of these birds, nor the cost of the bare missiles themselves—with such price tags as $2 million each for *Atlas;* $1 million for *Thor*.

There's talk of a requirement of perhaps 40 *Polaris*-launching submarines, at $60 million each—a total of $3.2 billion, again without the missiles. Each submarine will carry 16 *Polaris* missiles, which will run the total *Polaris* systems bill up at least another $1 billion. *Bomarc* as finally deployed may add another $5 to $10 billion.

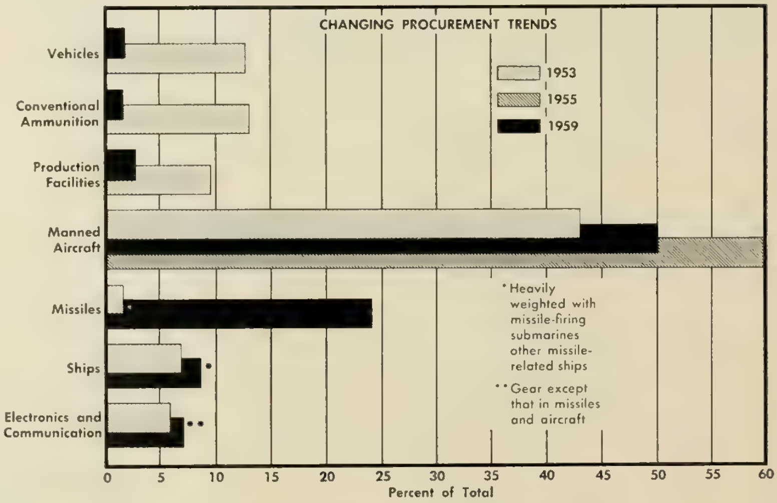
Even the little birds like *Sparrow* III, *Falcon, Nike, Terrier, Bull Pup*, etc., cost from $10,000 to over $50,000 each when produced and bought in thousands. Again, ground-handling and other ancillary costs (running usually to many times the cost of the birds themselves) are not included in the figures.

• **And space to come**—These are just a few samples of the costs of this interim age of missiles. Yet they serve to demonstrate that this is the most expensive era we have ever encountered. And, we haven't even begun to think of space—space, the age when a single vehicle may cost $1-billion just to develop; when an operational capability may top $1 trillion.

However, budgeting for missiles

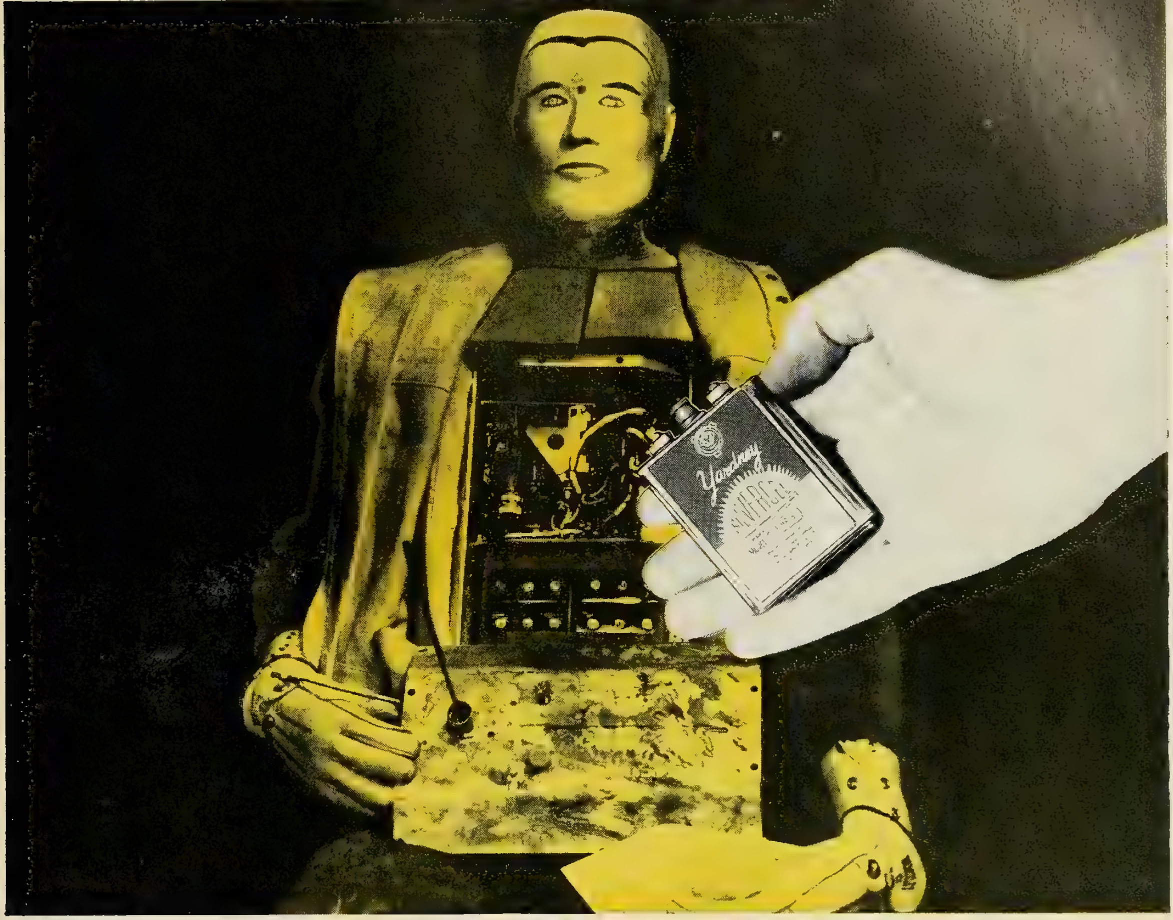


PROPORTION of overhead personnel to production men in the aircraft and parts industry indicates the relative rise in overall costs attributed to overhead increases. This trend has greatly increased labor costs.

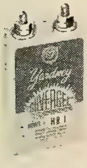


DRASTIC CHANGES in defense policies have resulted in almost revolutionary shifts of expenditure toward entire new industries geared to the space age. The decrease in conventional weapons is obvious.

...how to prevent heart failure at 1,500 m.p.h.



To perfect supersonic escape techniques, the Coleman Engineering Company has created Hurricane Sam, an amazingly real 6-ft., 180-lb. "man". Internally, a YARDNEY SILVERCEL® Battery—a power pack smaller than a human heart—runs strain gauges, accelerometers and a telemetering transmitter, that measure and transmit his almost-human reactions to a 1,500 m.p.h. catapult from Utah's Hurricane Mesa. Throughout this leap, and many others, Sam's YARDNEY SILVERCEL® heart continues to power vital instruments that will mean survival for human flyers under actual emergency conditions.



HURRICANE SAM'S HEART IS A **YARDNEY SILVERCEL**® BATTERY!

In this dramatic application, where reduced size and weight, and increased power were prime factors, only YARDNEY SILVERCEL® batteries could have been used. Up to 5 times smaller and 6 times lighter than any other battery of equal capacity, it offers the designer of electrical equipment many new opportunities for imaginative application.

There is a wide variety of standard YARDNEY SILVERCEL® batteries for such applications as remote-control work, communications equipment, portable power supplies, telemetering and instrumentation, as well as custom-built batteries for particular requirements.

WHY DOUGLAS ENGINEERS AND SCIENTISTS GO FURTHER...

GO FURTHER
WITH
DOUGLAS
FIRST IN MISSILES

At DOUGLAS

...your missiles assignment can be as big as your talents

Now in its 17th year, the Douglas missiles program is projected far into the future by such exciting new projects as THOR

Out of such veteran projects as Nike and Honest John are coming fantastic new missile systems to challenge the finest engineering talents in the land.

Since early in World War II, Douglas has been engaged in missile projects of prime importance. New engineering teams are constantly being formed for research, design, development and production. Engineers advance rapidly as Douglas expands its leadership in this challenging field.

You are stimulated to accelerate your career by the importance of each assignment ... by the help of your associates who are recognized experts in missile work ... by the vastness of opportunity for engineers in this company that is run by engineers.

There is no more promising future than that which awaits you in the Douglas Missiles Divisions.

THOR —*an intermediate range ballistics missile now going into mass production—has top priority in our country's program for national defense.*

provides a preview of budgeting for space flight. And those experts in government and industry who have reason and insight to look ahead are gravely concerned with what they see. In a word, the United States is already pushing the limits of its capabilities, not only financially, but technologically, politically and industrially as well. Yet despite this fact, we are forced daily to shelve for now, or forego entirely projects considered absolutely essential by some of the most competent military brains in the country. Reason: we can't afford them.

This is all in the missile age. Yet, it is an accepted fact that space flight, once it gets going, will compound the costs. It is a dilemma. At least it is so long as Russia can selectively choose her fields of battle, while we try to cover all eventualities. However, it is not a dilemma without answer. But in resolving it we may bring about even more radical changes in our way of government, our economics, our attitudes, etc., than we now contemplate.

The initial problems of space-age budgeting are manifiold, including: education; inaccuracies (both intentional and inadvertent) at planning and budget sessions; overlap of old with new military concepts; the leapfrogging pace of technological progress; obsolescence; selectivity; contracting methods; performance on contracts; utilization of resources; financial and political limits; costs estimating. The problem in a nutshell: to get inspirational-but-low-cost results through systematic planning.

Overriding, there is always the conduct of U.S. policy in world affairs. Though not strictly a part of military budgeting, it most definitely controls the level of military preparedness—thus, expenditures. This article is not concerned with the conduct of U.S. foreign policy, but assumes the competition between the United States and Russia, and thus the race for space, will continue indefinitely.

We must go into space. And, as always, we'll have to pay for it. This much we know. But beyond that we are groping. Here's a rundown on the problems and the current thinking on their solutions:

- **Education**—Education in the case of space-age budgeting refers to the problem of (1) convincing top planners of the need to go into space and (2) their acquiring enough general knowledge about specific things for them properly to guide our effort.

Though critically hampered by the self-interest and innuendo of bitter interservice rivalry, this is happening. That man can go into space and that, say, the moon has a direct military significance is now accepted. Only the details of how best to go into space remain in doubt. This includes, for example, recognition and appreciation of wholly new methods of approach—original thinking.

- **Inaccuracies**—A major problem is finding out just what should and should not be attempted. This depends, for one, on an accurate determination of the status of various projects and the level of development of various technologies.

These cannot be accurately determined so long as top military men present slanted pictures to both the Secretary of Defense and Congress. This occurs all too often, either intentionally or through inadvertence due to improper briefing by subordinates.

The Congress and the Defense Secretary are aware of this but, as yet, have taken no positive action to stop it.

Meanwhile, optimum planning for beating Russia in the military space flight area, within the limits of U.S. resources, remains impossible so long as fact is clouded in half-fact, opinion, service politics. At least top Pentagon officials now recognize that they cannot trust everything they are told.

- **Overlap**—Ever since World War II, this has been a serious problem. While whole new concepts of warfare are being proved, conventional forces must be maintained in up-to-date operational readiness, "just in case."

In large measure this means double spending. This kind of overlapping—ICBMs plus SAC bombers or spacecraft vs. aircraft, for example—is not susceptible to any easy solution, but must depend on judgment to keep overlapping costs to a minimum. We can gain some leeway this way (see bar chart) but not enough. Increasingly, the cost of new weapons have forced us to shave conventional forces. If anything, this trend will accelerate as we move into space. For example, we gained $4 billion in "new" programs, 1959 over 1953, merely due to cutbacks in vehicles, manned aircraft, conventional ammunition, etc.

- **Leapfrogging science**—It used to be that progress in weaponry occurred step-by-step. But while today it may take five years to progress from, say, step one to step two, it may also only take six years to jump directly from step one to step four. Is it more equitable to move in sequence from the B-52 to the B-58 to the chemical bomber (WS-110) to the atompowered airplane to (finally) the manned space bomber, or is it more equiatble to skip a couple of the intermediate steps and go directly to spaceships?

Actually, this oversimplifies the problem, but the step-by-step route costs immeasurably more than leapfrogging and takes a great deal longer. The tendency to start projects should be no less than the willingness to cancel them—or at least to knock them down from a weapons-system to a technological study. For example, when *Navaho* was canceled the decision might have been made to continue development of large ramjets, which have a great potential for close-in (40,000 miles) space flight.

- **Obsolescence**—This is tied in directly with the problem immediately above. In the step-by-step (or simultaneous) approach to development, a breakthrough may obsolete whole concepts overnight. Top Pentagon concern over this is mounting, and is increasing the willingness to cancel.

"To cut through to the truth," is one of the main reasons for setting up Defense Department's Advanced Research Projects Agency. If it goes as planned, it will be a powerful influence on the military's conversion to space flight.

- **Selectivity**—In the past, whenever the United States faced a new military requirement, it could and did take several approaches to its solution. This was back in the days when weapon systems were relatively cheap. In the space age, the shot-gun method will have to be abandoned. Of the many, many proposals for a "global surveillance system," for example, only a few will be study or preliminary design contracts. Even fewer will reach any kind of hardware stage. Only one, probably, will ever reach the production state. This harsh selective approach is dictated purely and simply by cost. And, it's effective only if the "right" project is chosen.

- **Contracting methods**—The wide variance between Army, Navy and Air Force contracting procedures, and costs and results obtained has led the Pentagon to initiate a detailed study (now underway) of the various methods of doing military business—AF's method of placing systems contracts with industry vs. Army's technique of keeping the systems responsibility with the various arsenals; Army's unique co-contracting system used, for example, on *Jupiter*, etc.

Another possibility: More and

more of the military arsenals and bases will be reorganized along corporate lines, particularly as regards bookkeeping. This has already been established (with marked savings) in shipyards, fuel supply offices, etc. Greater cost accountability in the military establishments will have its effect on industry.

• **Contract performance**—Target is the contractor who knowingly bids or negotiates low just to get the contract (or simply due to bad estimating) and then asks for and gets one extension of funds and time after another.

Pentagon is considering several methods of attacking them. One would involve giving contracting officers more authority to place contracts, meaning they would ignore the low bidder if they thought he would fail to perform according to terms. This has obvious disadvantages. Another approach that is held in more favor (but which faces stiff political opposition) would let size of profits on contracts very with performance, both up and down.

• **Utilization of resources**—This is primarily a manpower problem. But there's no point in budgeting more projects than we have the technical ability to handle. Right now 35-to-40 percent of all first-level scientists and engineers in the United States are working on government or government-supported projects.

Surveys and experience reveal that this is about the limit, without reverting to some kind of draft—either direct or indirect. Reasons include: many scientists just don't want to work on government projects due to security rules, red tape, etc.; can get more money developing a better car or deodorant, etc.

The Defense Department has decided that any military budget materially above the current $40-billion level would rapidly dilute our technical talent to a point where the more money we put in, the less we could get out. Nevertheless, we are faced with the prospect of a $1-billion-a-year increase in military and/or space flight spending for some years to come.

• **Financial and political limits**—This goes to deficit financing and/or higher taxes. To give even half the present serious space-flight proposals a proper try would cost us twice as much as we're now spending on defense, upward of $80 billion. Individually, Army, Navy and Air Force wouldn't have trouble hiking that total to $150 to $200 billion.

There would be only two ways to

An Invitation To Join ORO . . . Pioneer In Operations Research

Operations Research is a young science, earning recognition rapidly as a significant aid to decision-making. It employs the services of mathematicians, physicists, economists, engineers, political scientists, psychologists, and others working on teams to synthesize all phases of a problem.

At ORO, a civilian and non-governmental organization, you will become one of a team assigned to vital military problems in the area of tactics, strategy, logistics, weapons systems analysis and communications.

No other Operations Research organization has the broad experience of ORO. Founded in 1948 by Dr. Ellis A. Johnson, pioneer of U. S. Opsearch, ORO's research findings have influenced decision-making on the highest military levels.

ORO's professional atmosphere encourages those with initiative and imagination to broaden their scientific capabilities. For example, staff members are taught to "program" their own material for the Univac computer so that they can use its services at any time they so desire.

ORO starting salaries are competitive with those of industry and other private research organizations. Promotions are based solely on merit. The "fringe" benefits offered are ahead of those given by many companies.

The cultural and historical features which attract visitors to Washington, D. C. are but a short drive from the pleasant Bethesda suburb in which ORO is located. Attractive homes and apartments are within walking distance and readily available in all price ranges. Schools are excellent.

pay for this—deficit budgeting, which sooner or later would bankrupt the country through inflation; higher taxes, which are politically out of the question. Also, high taxes would eventually sponge up all the money for industrial expansion. Thus, even if there were no other limiting factors, money alone will force a major rationalization of the Pentagon's approach to budgeting.

- **Estimating costs**—This is one of the most complex budgeting problems of all. Labor and material costs are constantly on the rise. Bureau of Labor Statistics figures help to chart these. But in the more exotic areas, such as space flight (either manned or unmanned), they defy forecast. No one now can tell the extent of complexity—or simplicity.

Take, for example, manned reentry. This can be accomplished with wings and the "in-and-out" skip method, with retro rockets, with steel drag 'chutes, with magnet drag or—who knows? Which is cheaper now; in the long run? Which is more or less complex? How do you balance low-cost - but - maybe - primitive availability now, against long-term development potential? How do you balance, and having balanced, how do you choose? What are the criteria?

These are budget problems that run up the cost of any program. The difference is that in the past they were luxuries we could afford. Now it's difficult to see how we can afford the space age on a bare survival basis, much less with luxuries.

Contemplate, for a moment, a manned round-trip exploration of Mars under present budgeting procedures and levels of technology—or an operational base on the moon manned, maintained and serviced. They make present-day missile costs look like peanuts. These projects run to tens, even hundreds of billions of dollars.

Yet, within the next quarter century, we will be compelled not only to build a base on the moon, begin exploration of Mars, but long before that we will have to have operational military space capabilities patrolling the "immediate environment of earth." We can gain some by splitting the responsibilities among our allies and coordinating our efforts. But the bulk of the burden will inevitably fall on the United States. We can only do it, if we become efficient.

This is the one basic secret of space-age budgeting, one that requires unselfish cooperation from everyone concerned in any way with the space program.★

Food on Film—Best Space Diet?

Packages for food and other supplies for space travel may be made of edible, "vitamin-loaded chemical films," according to an Air Force packaging specialist.

Speaking before a meeting of the Southern California section of the Society of Industrial Packaging and Materials Handling Engineers, Albert Olevitch, chief of the packaging laboratory at Wright-Patterson AFB, said that if food value can be put into a film it would become a favored packaging material for space shipments.

Pointing out that films used today on such food items as frankfurters are digestible, he declared that it is entirely probable, that soon, containers will not be tossed into the ash can.

"They will be eaten or used as plant food," Olevitch predicted, "or they will be converted through some means into useful gases or some other product."

Noting that every ounce of material taken on a space flight must be made as useful as possible, the AF specialist said that packaging and other elements of supply must be considered along with the building of vehicles. Increasing priority is being given to packaging research and development in problems related to space operations, he added.

The lack of moisture in space will eliminate rust, but the relative vacuum of space increases problems of shock protection for packaged goods.

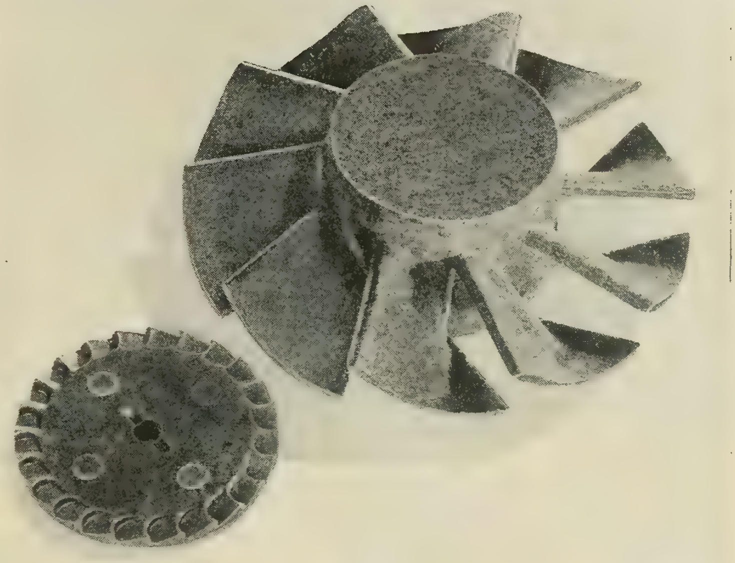
Acceleration and vibration factors in rocket vehicles are not expected to be as troublesome to packaging engineers as potential damage caused by accidental dropping of a package by a worker carrying it on the moon. As there is no air resistance, it is theorized that the impact shock would be prolonged; the dropped item would shudder for a long period after landing.

• **Dinner—bags of film?** Olevitch said the first container need for space travel will be those for cargo operations between earth and a space platform. Flexible, high-strength, nutritious films formed into bags or restraining walls appear to be the best solution. Where rigid containers have to be used, they probably will be made of aluminum or magnesium, or a new edible material.

Packaging engineers also will have a problem in designing test-instrument containers for moon drops. One possible solution is the use of compressed air to automatically inflate plastic bags to cushion the landing impact. To prevent the instruments from vibrating for long periods, the bags would have to be precisely punctured on impact so they would collapse gently.

Problem: Design a high-speed turbine wheel that can stand direct rocket blast

Solution: **R/M PYROTEX REINFORCED PLASTICS**



High-speed turbine wheels must stand direct rocket blast

When you are designing to meet the fantastic requirements of modern missiles and rockets with their tremendous forces and astounding temperatures, your problems are difficult ones. But you have an excellent solution: R/M Pyrotex—a complete line of asbestos-base reinforced plastic materials.

The Pyrotex products shown here demonstrate what these important new R/M materials can do for you. They provide exceptionally high strength-to-weight ratios, take a smooth finish, and can be mass produced to precision standards. Other missile parts for which R/M Pyrotex has been selected: rocket exhaust throats, nose and exhaust cones, blast tubes, grain seats, fins and combustion chamber liners. It will pay you to get more details on R/M Pyrotex.

THE COMPLETE LINE OF R/M REINFORCED PLASTICS

If your design demands all of the following features, find out more about R/M Pyrotex (felts, mats, papers and molding compounds):

- Heat and flame resistance up to 10,000°F or more
- Chemical and water resistance
- Relatively isotropic
- High modulus of elasticity from low to high temperatures (6 x 10^6 psi)
- High strength from low to high temperatures (60,000 psi)
- Improved surface of end items
- Exceptionally good dimensional stability
- Little or no surface crazing
- Good insulation and thermal properties
- Low cost
- High strength-to-weight ratio

Social studies must go on, to find out . . .

How To Keep Space Crews Content

by Donald N. Michael

WHEN WE CONTEMPLATE the social psychology of space crews, we are attempting a far more difficult thing than is the case when we predict the hardware in which these crews will be sent into space. The social psychology of group behavior has far to go to reach the state of advancement on the hardware side—in spite of the spectacular work of psychiatrists, social psychologists and cultural anthropologists.

Therefore, it is not possible to state categorically the sociopsychological problems to which space ship crews will be exposed, nor the training and selection procedures that may be used. What can be done, however, is to list some of the social and psychological circumstances and consequences which probably will have significant implications for space crew operations. Such a list makes it clear that we cannot be sanguine about man's capacities to work effectively in space over long time periods.

Flights of less than, say, two-weeks duration probably won't produce as many of the problems to be described, though trouble can arise at any time.

• **Environment is first**—The first spaceships may carry crews of more than one and, say, less than six. (If the crew were much larger, interpersonal relationships will be such that the fact that they are in space will make relatively little difference.)

Volume per crew member will be at a premium. Even if the ship is constructed in orbit, the cost of construction will increase with the size and facilities of crew quarters, since the materials will still have to be ferried from earth. It is assumed that there will be no radical breakthrough in propulsion methods—if volume per crew member is essentially unlimited, many of the special sociopsychological problems disappear.

The nature and mission of many spaceship operations are such that the diversions available to crew members will be relatively limited and monotonous. All there is to respond to are the instruments, other crew members, and whatever items are provided for recreational and off-duty purposes—limited because of cabin space constraints. During the freeflight periods of the trip there will be little vibration or outside sound. Even "viewing the scenery" will be limited, since micrometeorites would abrade an unprotected optically clear surface. Hence viewing may be infrequent.

And, when the crew does look at the universe, away from the sun, it will see blackness, with myriads of steady points of light of slightly different colors, all of them so far away that there will be no sense of depth. Toward the sun, the intense contrast between light and dark will make view-

the answer to many design problems

COLD-EXTRUDED

ROCKET and MISSILE Components

Advanced cold-extrusion techniques by Norris-Thermador now provide the answers to many design problems. This method is no longer limited to low carbon steel, aluminum and other soft materials. Norris-Thermador is successfully extruding AISI 1030 and 4130 steel and high strength aluminum alloys.

Here are important advantages of cold-extruding:

- Closer as-formed tolerances
- Zero draft parts with uniform wall thickness
- Higher mechanical properties
- Improved surface finish
- Lower material and machining costs

Cold-extrusion may be combined with deep-drawing, tapering, coining or swaging to produce integral parts which formerly could be made only as multi-piece assemblies.

. . . Keeping Space Crews Content

ing painful or at least very difficult.

Since the constellations are likely to appear in different arrangements from those perceived on earth, there will not even be this familiarity to orient upon. Thus, the universe may not offer much in the way of stimulus novelty. (Satellite occupants may have a better time of it with the earth to look at.)

Finally, disaster will be close at all times: from meteorites big and small, from equipment malfunctions, from human malfunctions and probably in the long run, from genetic damage to crew offspring from cosmic rays. Early spaceships and their crews will most likely represent an ecology with almost no tolerance for error or malfunction.

• **Then social**—The social and psychological factors combined with the environmental ones, may also generate personal and interpersonal behavior that could mean the difference between success or failure.

It is obvious that the crew will have to be carefully selected. But what standards, screening, training procedures must be developed to produce a crew that can cope with such an environment and with each other?

First, it must be assumed that membership in a space crew will be voluntary, and that volunteers have been fully apprised of the dangers they face. Who would volunteer for this activity? We might list men attempting to escape from something; men who want to prove something to themselves or to others; men who are curious about new experiences; men dedicated to service, either military or scientific.

These people are willing to go into space in spite of the unprecedented and extraordinary hazards. Thus, whoever they are and whatever their motives for volunteering, they are not likely to be "normal" human beings—normal humans find less risky means of meeting their problems. This is not to decry these motives; they have often served the human race well. But the origins of these motives must be understood in order to evaluate their consequences, under the circumstances faced by space crews. The man who is dedicated to military service may not be able to endure boredom as well as the man out to prove compulsively that he is better than his father was.

The problem, then, is to find the combination of normality and abnormalitys that will make the best team members.

"Team members" is the important term here: an antisocial, possibly slightly schizophrenic, personality might survive adequately in a one-man spaceship. Such a man probably won't do on a team. And yet, will the typical socially interactive and dependent personality do either?

• **Too close?**—The adage says that familiarity breeds contempt. Under some circumstances it breeds more than that: in constricted quarters it may well be a major threat. French anthropologist and explorer Gontran de Poncins spent part of a winter with an eskimo trader, Paddy Gibson, in an isolated outpost and had this comment in his book KABLOONA:

"I liked Gibson as soon as I saw him, and from the moment of my arrival we got on exceedingly well. He was a man of poise and order; he took life calmly and philosophically; he had an endless budget of good stories. In the beginning we would sit for hours . . . discussing with warmth and friendliness every topic that suggested itself, and I soon felt a real affection for him.

"Now as winter closed in round us, and week after week our world narrowed until it was reduced—in my mind, at any rate—to the dimensions of a trap, I went from impatience to restlessness, and from restlessness finally to monomania. I began to rage inwardly and the very traits in my friend . . . which had struck me in the beginning as admirable, ultimately seemed to me detestable.

"The time came when I could no longer bear the sight of this man who was unfailingly kind to me."

Both military and civilian sources indicate that under conditions of persistent danger, constrained operating environment, and mission-length of unusual duration, similar responses have characterized relationships between crew members in relatively conventional, but technologically advanced environments.

Thus, it might be that a likely combination of personalities, would be persons who are almost social isolates. Such men would be intolerable or infuriating under conventional conditions. But such personalities might be sufficiently insulated from the others to permit them to maintain themselves as an operating unit.

Of course, there is at the moment, no certainty that these social isolates would effectively fulfill their technical functions. After all, if they are so insensitive to their fellow crew members, it may be that they will be insensitive to the social commitment they accepted: to perform certain technical tasks with required precision and intelligence.

• **Weightlessness a factor**—Does the operational outlook for a more socially interactive crew look brighter in spite of the difficulty of keeping each from becoming hateful to the other? In some ways, yes. For example, man's self-image derives in part—and in good part is maintained—by his learned awareness of the sensations and responses of his body. It is also defined and maintained by his learned responses to, and awareness of, the environment in which he lives.

Since a prerequisite for initial screening will be excellent physical condition, it is not difficult to imagine that many of the personalities whom we might consider for space crews would have more than the average awareness of their bodies. And since another prerequisite must be special competence and special interest in the mission, he will have had more than an average exposure to an environment rich in content and change.

But in a space cabin the crew member is probably going to be weightless and the environment is going to be stimulus-poor.

Weightlessness means that there will be many things about the operation of the crew member's body which will be different, and which he will not be able to control as easily or as precisely as had been his want.

In effect, then, his self-image is threatened. For example, the man who assuages his anxieties about his masculinity through his physical control, might find himself anxious about his masculinity if he loses this control. Unless otherwise reassured, say, by his fellow crew members, he might attempt to "prove" his masculinity in other ways—such as bullying.

Psychological difficulties possibly arising from lack of weight can't be ignored. So far about one-third of the subjects exposed to weightlessness found it definitely distressing while another one-fourth found it "not exactly a comfortable feeling." The exposure time has been less than one minute. There is a long way to go before it can be concluded that weightlessness will not present important psychological difficulties.

The social isolate would also suffer anxiety under these circumstances but for him social support would neither be forthcoming, or as important. The choice of social isolation as a way of life is itself a means of coping with a threatened or tortured self-image.

• **Remedy for boredom**—A socially interacting and emotionally in-

World's Most Rugged
PRESSURE TRANSMITTER

Easily disassembled for clean out and parts replacement.

TABER TELEDYNE

. . . is relatively insensitive to vibration or shock because of its bonded strain gauge construction. Use with standard servo indicators, recorders and controllers to measure liquid or gas pressures. Handles extremely corrosive media, including fuming NITRIC ACID. • Linearity 0.25% • Hysteresis 0.5% • Ambient temp. —65° to +250° F (18° to 121°C) • Pressure Ranges: 0 - 300 to 0 - 10,000 (PSIG).

160° C TRANSISTOR AMPLIFIERS . . . SUB MINIATURE

Want big service in a tiny space? Our 207S is the answer. 400 G's at 2000 cps., 40 db open loop gain and 20 db closed loop gain ± 0.5 db, — 60° to + 160° C, stainless steel case.

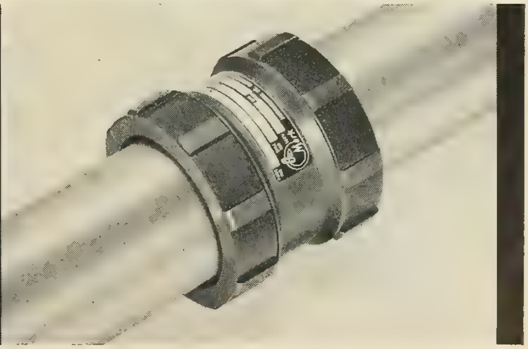
ON MARK
flexible couplings for aircraft



Typical of the precision-built flexible couplings for aircraft designed and produced by ON MARK is Part No. 6-6001, here illustrated. It has successfully met, without deviation, qualification tests under MIL-SPEC C-25014 (USAF), and allows a total of ¼" axial motion and ±3° flexure. These efficient ON MARK couplings can be completely assembled by hand without wrenches or torque value requirements.

Standard AND10058 and AND10060 beaded tube ends are used for fitting attachment. Standard O-rings are used for seals; standard gland dimensions allow space for seal swell and permit easier motion of the tubes. With these couplings, tube crushing at the bead is eliminated. Temperature limitations are established by the compound used for seals, pressure limitations by the tubing wall thickness and bead stiffness. Fluids other than fuel can be handled.

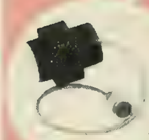
Rate Gyros

by Gyro Dynamics are highly sensitive instruments utilizing the flotation concept of design. Precision-built they are smaller, lighter and capable of maintaining the highest degree of accuracy through extremes of shock and temperature.

As a result, these rate gyros have been qualified as an integral part of flight test and stability augmentation systems of many current missile and aircraft programs.

Standard Miniature

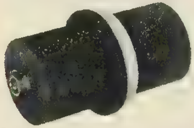
Designed for applications —in AC or DC—where high vibrational or accelerational "G" loads are expected.



Sub-miniature

Smaller version of AC rate gyro capable of operating directly from 115V. No transformer or choke coil required because of high "Q" design. Damping: .4 to 1.0; Temp: −40°F to +165°F.

NOW UNDER DEVELOPMENT
AVAILABLE SOON FOR PRODUCTION
TWO-AXIS FREE GYRO



- Perfectly floated construction
- Isoelastic structure
- Synchro on outer gimbal
- Pots on both gimbals
- Unique caging system

Gyro Dynamics can develop and manufacture a single unit or a complete "system"—from either your design or our own. A staff of specialized engineers are available to assist you with any problem in this field.

terdependent crew may help counteract the boredom and isolation of some long space flights. Literature on the psychology of boredom and of low-stimulus environments points in the same direction: emotional depression, intellectual deterioration and a tendency to hallucinations.

This general deterioration of mind is vividly described by de Poncins:

"Insensibly . . .things changed . . . silence that had been so remedial, that had soothed me . . . began to seem to me a weight. The horizon was closing in round me.

"But more than this, an almost physical operation of shrinking was going on. I who had come from outside had first been enclosed by the Arctic. Then my horizon contracted to the limits of Gjoa Haven; from Gjoa Haven the circle had been reduced to the dimensions of the post; and now, in the dead of the polar winter, the line I hesitated to cross was drawn in a radius of five feet round the stove."

Consider then a space cabin, its routine of occasional measurements, the boredom of monitoring the equipment, its physical constraints, its weightlessness and the pervasive sense of isolation. This environment may well produce depression and hallucinations. It may be that only the presence of other crew members will provide each member with criteria for determining when he is hallucinating and when he is not.

It would seem, then, that a crew of personalities at least somewhat emotionally dependent on each other might have some advantages.

But these advantages can only be gained at the expense of weight and thereby cost, since such a crew will require certain adjuncts to the primitive space cabin environment.

Certainly the opportunity for privacy is a prerequisite. The operation of the ship might be so organized that each man is usually isolated from the others—with some central area where they can come together. Some volume will have to be provided for physical exercise; this might also be the meeting area.

Certain stimulus enrichers must be provided: as simple as a kaleidoscope (which has the great advantage that it never provides the same stimulus twice); possibly elaborate pinball-type machine which would encourage the setting of tiny goals and provide the opportunity and the challenge of reaching them.

It may take a TV or radio reception capability to keep the crew truly in touch with reality. It may even develop that mixed-sex crews are the more efficacious for many reasons, not the least of which is that the temperaments and values of men and women are sufficiently different to provide much stimulus each for the other. Mixed crews would present problems, but not unique ones.

In view of the nature of some of the factors contributing to the difficulties in selecting space crews, it may be worthwhile to surmount them by trying to bypass them. One approach worth consideration is that of recruiting crew members from other more sedentary and less time-bound cultures than our own.

• **Training**—It is clear that we face equally vast problems in training space crews. For example, the need to readjust the self-image in the light of the behavior of a weightless body probably can be transferred from the space ship environment to a prespaceship training period aboard a weightless satellite.

It seems clear that we will be able to put crews into space well before devising adequate psychological tests.

Since the satellite itself may for many years be the first and only testing ground for prolonged exposure of space crews, there will also be the difficult problem of selecting men for this crew. Presumably some sort of regimen of one-man-satellite training exposures will be developed in order to select men for this crew, but by any measure selection of the first crews will be difficult.

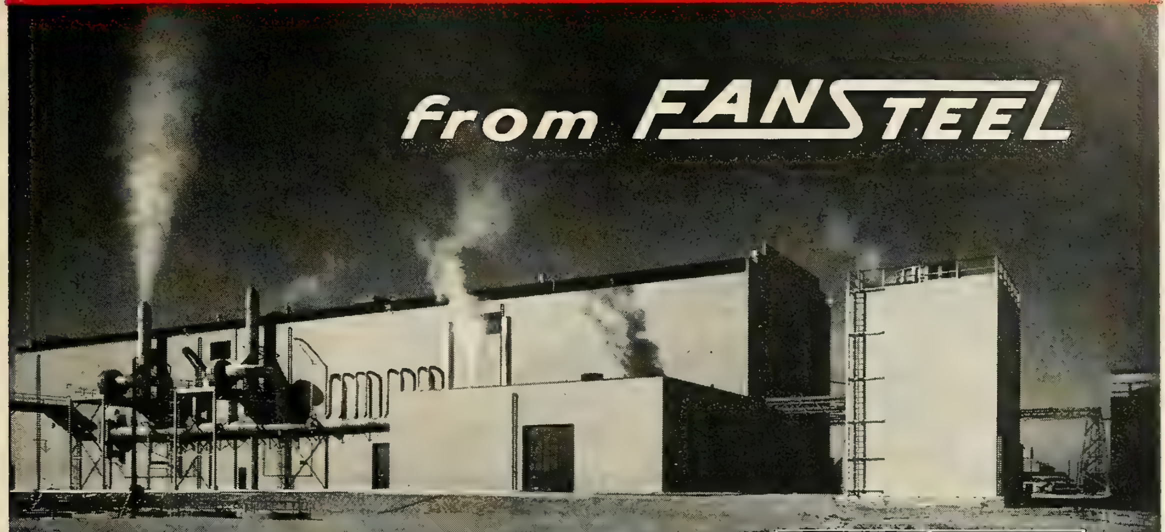
• **What can be done**—What can we do, then, to develop a plausible social psychology of space crews before the event?

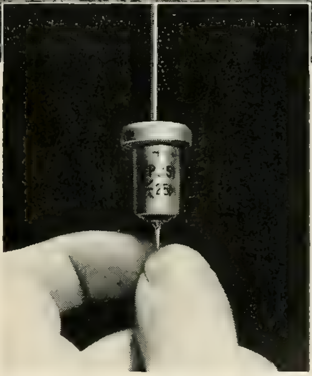
For one thing we can look to the behavior of terrestial explorers for insight into the social psychology of teams living under environmental extremes.

Then too, most exploration was undertaken in an age when men were richer in self-sufficient resources than is the rule today. This inner strength is even less likely to be the rule as population and urbanization increases and imposes greater pressures toward social conformity.

We can continue and extend studies on behavior under confinement presently underway at the Wright Field Aero Medical Labs, and by Lockheed. We can attend more seriously to the work of the psychiatrists and the cultural anthropologists. We must come to understand that the social psychology of space crews is essentially a problem in the social psychology of society. Larger crews, plenty of room and sufficient diversion would eliminate many of the problems which give space crew life its special and difficult characteristics.★

NOW EVEN MORE
TANTALUM CAPACITORS





One of the dominant reasons for building the Oklahoma plant was the great demand which grew out of Fansteel's development of the tantalum capacitor. Fansteel produces a complete line of tantalum capacitors, and in addition, supplies tantalum materials and components to other leading capacitor manufacturers.

Fansteel's new facilities can now produce 11 times more tantalum capacitors than were produced in the United States during 1957.

With the big new plant in Muskogee, Oklahoma and expanded facilities at North Chicago in full operation, all Fansteel tantalum capacitors can now be shipped *from stock*.

As the world's first major producer of tantalum capacitors, Fansteel recognized the rapidly increasing need for more tantalum and initiated a $1,000,000 expansion program at North Chicago in 1955. In less than six months, even more production was needed to meet the constantly growing demand. So the $6,500,000 Muskogee tantalum-columbium plant was planned, privately financed, and built with the most modern automated and cost saving equipment.

All of this adds up to more Fansteel tantalum capacitors . . . delivered on time . . . in quantities to meet any of your production requirements.

Ask for latest bulletins on these Fansteel capacitors:

Where does your group fit . . . .

Dr. Tolcott: Our role is to contribute . . . .

Getting Set For Space Flight . . .

The five scientists participating in this exclusive m/r conference are members of the professional staff of Dunlap and Associates, Inc. of Stamford, Conn. In its 10th year, this organization engages in contract research and consulting on commercial and military problems, particularly those problems where the human being is a central factor. Much of the work done by the firm now relates to missiles and is identified with such terms as Human Engineering, Operations Research, Personnel Research, and Motivation Research. The participating scientists are: Drs. Martin A. Tolcott, Vice President and Secretary; Kenneth W. Yarnold, Vice President; Joseph E. Barmack, Assistant Vice President; Donald N. Michael, Senior Research Associate, and Jesse Orlansky, Vice President.

Q: **Why should we explore space?**

A: (Tolcott) In my own opinion there are two main reasons: one would be the collection of scientific information which would be useful to mankind in general; the other is the collection of information that would be militarily desirable to the United States.

Q: **Well, do you think that this is any more urgent now that the Russians are already up there with Sputnik?**

A: (Tolcott) I think with good planning this shouldn't have any effect.

Q: **Do we have good planning right now?**

A: (Tolcott) I think the new emphasis on scientific research is perhaps the most important manifestation.

A: (Orlansky) I dare say a year of planning is necessary; if the planning was good, it would be time well spent. None of us, I'm sure, are so gifted that we have all the knowledge necessary for space flight, now or even a year from now. However, for political purposes, one might want to get some action as quickly as possible.

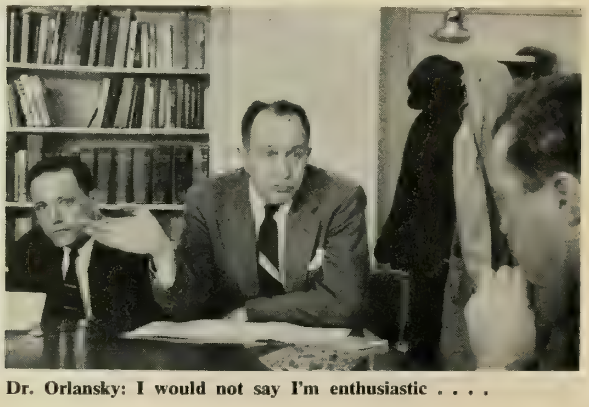
A: (Barmack) I would like to supplement Marty Tolcott's two reasons for exploring space with two others: he mentioned (1) military and (2) scientific. To these I would add (3) economic and (4) political. I am highly dubious of the military value of going out into space.

Two military functions have been suggested by official sources: to provide a platform for releasing bombs; as a reconnaissance device.

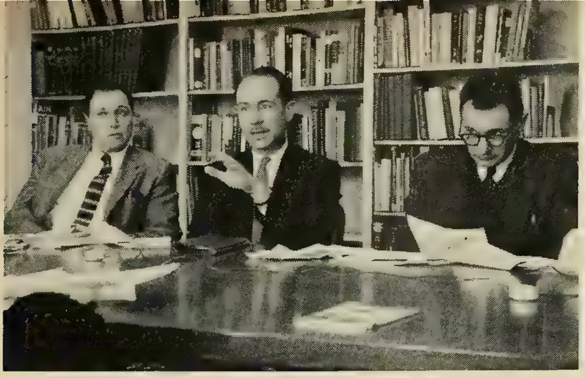
Q: **Would anyone like to enlarge on the planning aspect?**

A: (Yarnold) I would like to make a statement on planning. I don't think any scientist can ever sit down and so an so *should* be done. But he can do a study as to what might happen if so and so *were* done. I do not believe that there has been enough operations research devoted to the question of what do we gain or lose through various sorts, sizes and shapes of space programs. The public has been complaining that it's now six months since Sputnik and we still haven't a program. I think you're right—that there has not been any real scientific effort to study what such a program should be. There has been only some talk.

Dr. Michael: Two other things have to be added . . . .



Dr. Orlansky: I would not say I'm enthusiastic . . . .



Dr. Yarnold: I think the cost would be trivial . . . .

Dr. Barmack: When all is said and done . . . .

Q: **How long do you think we will have to talk?**

A: (Yarnold) Unless we adopt a scientific method of evaluating the probable consequences of each type of action, we'll talk forever. First we should set up a study group.

Q: **Who should these people be?**

A: (Yarnold) They should include many types—economists, psychologists, physicists, engineers. They should have a definite mission, a definite budget and a definite time limit. You might require some decisions within three months. I do not think it's being done now. Over and over again, very commendable and competent groups make studies, and the results are buried because whoever sponsored it doesn't like the results.

A: (Michael) Two other things have to be added: It has to be a group which is not obligated to beg any questions, and it ought to be so set up that findings are published—even if in sanitized form.

Q: **Will you elaborate on this study group. How big should it be?**

A: (Yarnold) You ask me to speak very much off the top of my head—just what I'm objecting to doing.

But I would think that the group itself should be fairly small, but very high level. We have background for such a group in the Weapons System evaluations group. Their charter is something like what is needed. They should have at their disposal lots of sub-groups.

The basic leading group itself should be small, to prevent discussion and study going on forever—there should be a definite time limit. The group should have a budget and be told to come up with its best recommendations at a definite date.

I think the cost will be trivial compared to what we can gain—it could probably come up with a very good study in perhaps three months or less, and spend less than $500,000.

Q: **Let's ask the question—Do you think it should be military or civilian?**

A: (Barmack) In that connection, Vice-President Nixon was recently quoted as saying that the exploration of space is a civilian task. He said that the goals of basic research in the space field should not be set by the military—we can't tie down our scientists to specific objectives that military or political leaders may deem possible.

A: (Yarnold) It depends on what you want. If you want to go out to fight, then you're just as well off letting the military set the research goals. If you want to go for some other reason—to advance science—then you might turn it over to civilians. If you have an applied objective the fact that a program is turned over to civilians doesn't make it basic research.

You know, you asked me a while ago to talk off the top of my head about what I would really like to see. Speaking for myself, I'd like to see a Congressional committee set up the study. It would thus not be tied either to the military or civilian side—but the government as a whole. It might even work.

Q: **Let's assume the action you suggest has been taken, the study is made and is successful. Then what will happen to their recommendation to Congress?**

A: (Yarnold) The recommendation would present a choice to the parent Congressional committee.

Q: **Where would such a recommendation lead?**

A: (Michael) I feel that if the findings are to be implemented, the report has to be prepared in such a manner that its findings will be the responsibility of im-

Dr. Michael: Let's take a runthrough . . . .

Well, we can wind things up . . . .

portant leadership in this country . . . as did the Rockefeller and Gaither reports. If it's just a report without big name behind it, it may very well die on the vine, no matter how good it is.

Q: **Let's switch again, to another important phase. What about education? There is a disagreement about whether we should teach astronautics in the schools. Should we augment the educational program, and to what extent would we include astronautics?**

A: (Barmack) This question can be broken down into many sub-questions. As you know, the Air Research and Development Command has been considering development of a post graduate university for training astronautic scientists. I don't know what the current decision is—at last reports, it had been cut out for budgetary reasons.

One may also raise the question as to whether you should have a special form of engineering training at the college, in addition to the post-graduate level. Finally, how far down in the educational system should instruction reach—down to the high school?

A: (Tolcott) It seems to me that there's a lot that can be done by augmenting the basic scientific courses already in existence. Chemistry and physics courses might be strengthened with some of the information that might be obtained through space flight.

Q: **There seems to be general agreement here, but are we capable of doing it? Have we the manpower and the money to change our textbooks?**

A: (Yarnold) We certainly have the money, and experiments in which a few science teachers are spread around among a large number of students by television techniques are interesting and encouraging.

I think perhaps we have to fight a public posture in which society as a whole seems to be afraid of science.

A: (Barmack) May I throw in a note here? It is very easy for us to identify problems that require a mathematical or physical science approach for solution. But it takes more than math, physics and engineering to win the struggle. Aren't we plugging for the wrong disciplines?

A: (Yarnold) I couldn't agree with you more whole heartedly.

Q: **You say that we are capable of improving our educational system, but do you think that we are attempting to do this? Are you satisfied with what has been done?**

A: (Yarnold) No, I'm dissatisfied with it, but I think there is an attempt being made. The thing is being discussed, at least.

Q: **What should we do to get the leadership we'll need to push such changes through?**

A: (Yarnold) For one thing Congress could earmark money it appropriates for education: tie it definitely to teaching of science. Or, we could set up national standards, with nationwide examinations which students are expected to pass at stated intervals.

Q: **Will it require additional funds?**

A: (Michael) It probably will. But in order to get the kind of public support and public interest needed, we will have to get a substantial shifting of American values and standards. This will require planning, and involves more than the physical sciences: considerations of philosophy, sociology and psychology must be brought in.

Q: **Who should do it, and how should it be done?**

A: (Tolcott) It seems to me it should be

DO YOU NEED THESE FACTORS IN A VALVE?

2" Fabrilite Valve (shown 5/8 actual size)

☐ Lowest weight-to-size ratio
☐ Minimum size above duct diameter —no projecting flanges
☐ Exceptionally rugged construction
☐ Corrosion-resistant materials
☐ Stainless-steel shell and operating parts
☐ Withstands temperatures to 700°F.
☐ Withstands ambients to 450°F or more
☐ Low electrical requirement, AC or DC —no limit switches needed
☐ Operation on duct pressure as low as 3 p.s.i.
☐ Only one moving part
☐ Very low-leakage seats
☐ Meets military specifications
☐ Fast-acting, inline operation
☐ Reduced maintenance
☐ Maximum reliability

VĀP-AIR Fabrilite
For Air Craft, Missiles, Missile Stands and Industry.

LIGHTWEIGHT, FABRICATED INLINE VALVES HAVE THEM ALL!
Available sizes—¾" to 4"
Stainless, Aluminum, or Monel

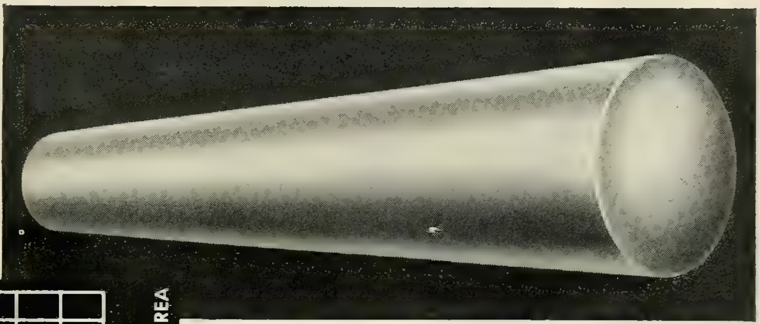
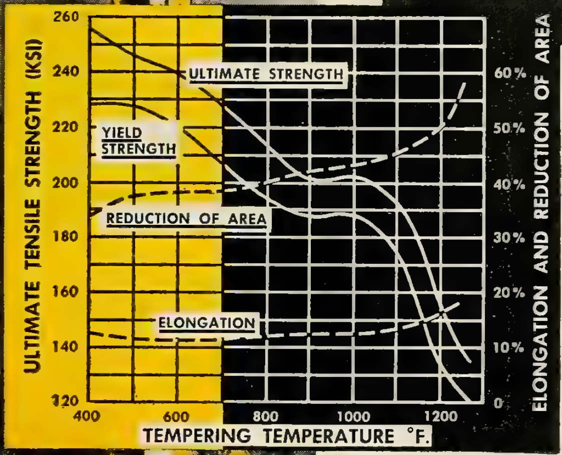
Newest advance in missile tankage

A. O. Smith flash-welded and fusion-welded units have exceptional strength . . . can be furnished in sizes and configurations to meet your designs exactly



Typical missile propellant tank as produced by A. O. Smith. Diameter is 40", length 28'. The highly stressed longitudinal welds in the "roll and weld" fabrication method can be flash-welded for higher strengths.



Materials are available which will produce properties indicated above. Current lightweight, high-strength propellant tanks are being produced in the strength range indicated by the yellow area of the chart.

Here's a new opportunity to gain wider design latitude. A. O. Smith can fabricate liquid or solid propellant tanks (cylindrical or spherical) and pressure tanks to practically any chamber size.

A. O. Smith has produced tanks with guaranteed minimum yield strengths of 190,000 psi. . . . wall thicknesses from .050"-.220" . . . diameters over 50" . . lengths to 28'. Proposed designs and recent fusion weld developments indicate minimum yield strengths of 210,000-225,000 psi are attainable in weld areas.

For details on the A. O. Smith facilities and capabilities available, write direct.

Through research . . . a better way

P-E optical range instrumentation provides vital missile data

checks behavior from production through flight

Engineers must *see* what is happening to a missile at every stage of its life. And Perkin-Elmer optical range instruments help them see . . . on the production line where stable platforms are aligned by P-E theodolites . . . at the launching site where P-E instruments first lay the missile for flight and then record vital data about its ascent . . . downrange where P-E tracking instruments let observers watch – and learn from – its meteoric journey across the skies.

Data grows more complex as the state of the art advances and the demands upon optical range instrumentation multiply. That calls for a high order of creative engineering. The number of P-E instruments in the missile program today demonstrates the emphasis that Perkin-Elmer places on this singular talent.

ROTI (Recording Optical Tracking Instrument) Mark I — Twin telescopes equipped with cameras track and record flight data on missiles and airborne objects.

ROTI Mark II — Single telescope and camera with velocity memory circuits for tracking objects that pass behind clouds or other obstructions.

TPR (Telescopic Photographic Recorder) — A mobile unit similar in function to ROTI, but designed for easy mobility to any site accessible to prime mover.

Kth57 Cine-Theodolite—Intermediate range instrument for evaluation of AA fire, monitoring bombing runs, etc.

Azimuth Alignment Auto-Theodolite — Short, intermediate and long range models align inertial guidance systems at assembly and at the missile launching site.

Sighting Telescope — Combines wide field of view and high magnification for quick target acquisition.

SATRACK (Satellite Tracking Camera) — Employs P-E aspheric optical systems. High light-gathering power, wide field of view will enable camera to photograph IGY satellites.

Auto-Zoom* Lens—Extends versatility and range of standard closed circuit TV cameras. Permits remotely controlled wide-angle or closeup observation of action, target or instruments.

An interesting booklet, "Optical Tracking Instruments," describes these and other P-E instruments for the Space Age more fully. Write for it.

done on a local level—we as individuals have an obligation to do something in our own school boards. It is a problem to be attacked on a number of levels. On a national basis, I think we should contact our Congressmen and give them our ideas.

A: (Yarnold) Without better education and a lot more education, we cannot solve any of the problems. We can't have an adequate space program.

Q: **Well, do you think this is in any way tied up with the fact that we still don't have a space program—six months after Sputnik was launched? Does the scientific planning take longer or is it being influenced by politics?**

A: (Tolcott) I think I perceive in your question a more limited view of space programs than I'm thinking of. A space program involves a lot more than launching satellites. The launchings are the part that the newspapers publicize most, and which therefore become identified with our national strength. This is unjustified and dangerous. In the broader sense, we do have a space program. The real issue is the relative amount of effort to be allocated to each phase of it.

Q: **What is your opinion right now of the value of space flight?**

A: (Orlansky) I would not say I'm enthusiastic. I am neither for or against space flight. Practically everyone who owns an airplane company wants to transform it into a missile company—therefore they are for space flight and don't need our support.

The ingredient that we can bring to space flight is a degree of rationality and planning so that we will know ahead of time why we are doing it and what we are going to get out of it. We are especially interested in the way in which men will be employed in this venture.

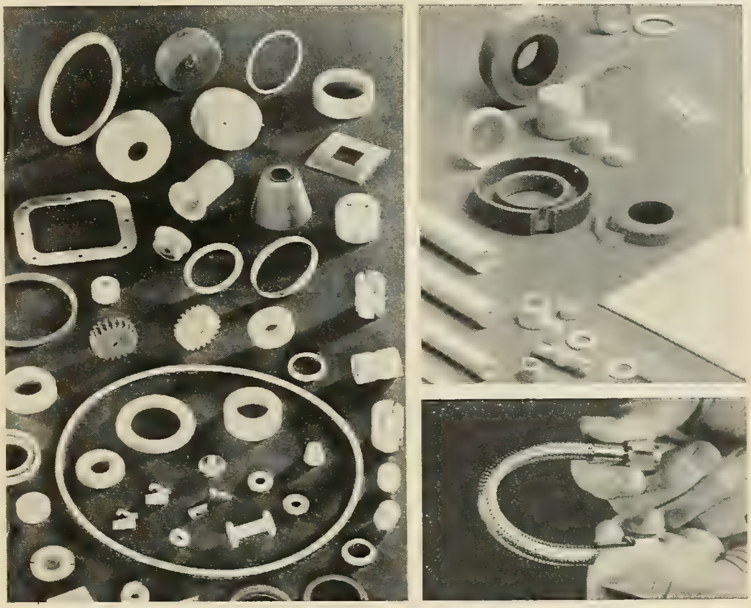
After all, Dunlap and Associates don't sell rockets and don't build airframes. We do have special knowledge about human behavior in the role that man can play in space flight. This includes how society would be affected, how the man in the street reacts to space flight, and how the vehicles are designed.

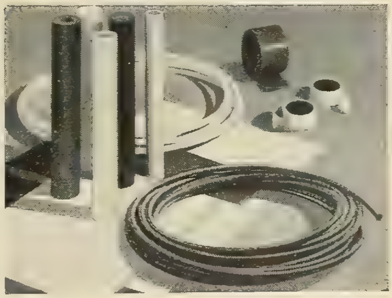
Q: **Well, I think we can wind things upon that. How does that sound?**

A: (Michael) Let's take a run through and see if anyone has anything to add.

A: (Tolcott) It still seems to me somewhat incongruous to be talking about space flight when, for example, we can't run our trains on earth when the

If the job calls for TEFLON*
use R/M and be sure!





Minimize the risk of failure of a "Teflon" part or component at a critical point by getting it from Raybestos-Manhattan.

R/M has been in the forefront of "Teflon" development from the beginning. Our engineers *know* "Teflon" . . . its unique characteristics, its vast potentialities, how it can best serve the needs of a particular industry. Our production men have the know-how and complete plant facilities to follow through. You specify it; they fabricate it.

We understand the complexities of your problems—friction, extremes of temperature, the corrosive action of exotic fuels, etc.—and will give you all possible aid in designing, molding or machining the R/M parts or components you need. Make R/M your headquarters for all the "Teflon" products you need. Call upon your nearest R/M district office for the cooperation you require—or contact us direct.

R/M "Teflon" products for the aircraft, missiles and rockets industries include flexible wire braid covered "Teflon" hose; "Teflon" sheets, tape, rods and tubes; rods, sheets and tubes in certified and stress-relieved grades (X-ray films for sheets and rods are available); centerless ground rods held to very close tolerances.

DIEHL*

SIZE 11 RESOLVER REACHES NEW STANDARD OF ACCURACY

0.03% TOTAL FUNCTIONAL ERROR

Missile guidance today requires more accurate Function Generators, Data Transmitters and Phase Shifters.

The DIEHL Size 11 Resolver is an answer to these problems.

DIEHL engineering and exceptional manufacturing methods insure a *uniformity* of product with a great percentage of the total production well within the 0.03% Total Functional Error. DIEHL defines percentage of Total Functional Error (T.F.E.) as: theoretical sine minus Actual Reading divided by sine 90° multiplied by 100.

A recent statistical check of one standard DIEHL resolver shows:

74% with T.F.E. less than 0.020%
22% with T.F.E. from .... 0.020% to 0.025%
4% with T.F.E. from .... 0.025% to 0.03%

This kind of quality eliminates the risk of culling special units from regular production.

All DIEHL standard units are available within 10 days. We invite your inquiries.

temperature drops below twenty degrees. It seems to me that there's a big gap between our present technological knowhow and the kind of speculations we've been engaging in during this session today.

I think the only general point I would like to make is that all the problems of how should we explore space; how much should we explore space; should we explore space; are all tied to our national capability, which now appears to be at a lower level than that of the Russians. The real problem which will in turn solve all of these other problems, is scientific education. Without that we have nothing—we never will have a space program that's any good, or any other program that's as good as we should have to keep the U.S. in its rightful place.

Q: **Then do you feel that planning for a scientific education should precede planning for a realistic space program?**
A: (Orlansky) I think the planning for both should be done concurrently. The requirement is for research and planning, not for expertizing. We have research methods readily available to get the facts that will clearly identify alternatives and their possible consequences.
A: (Yarnold) I would just like to suggest that certainly for space flight and for the future ahead of us, we need a scientific education, but my strong feeling is that if we're going to cope with the society that space flight provides—both for good and for evil—we're going to need more than scientific education. We're going to need a humanistic education—in part scientific—for the majority of our population, or we will end up with technological chaos.
A: (Barmack) I would say in concluding what we've been discussing here that for myself—and maybe for all of us—efforts in the exploration of space should be encouraged to a considerable extent. The decisions on government support should be based on a careful assessment of our national goals, the things we might do to achieve these goals, the problems to be encountered, the prospect of success, the costs and the possible utility of the findings that have been made.

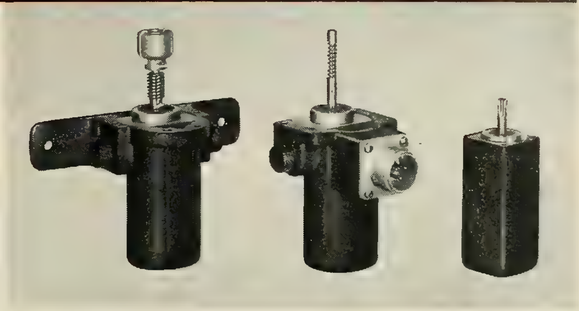
Then, when all is said and done we'll get certain scientific information of very great value for military purposes and certain basic scientific information of general value. Either of these could be sufficient justification. And, of course, you can never take away the satisfaction of curiosity and sense of adventure all this will give us and the nation.

QUALITY
ACTUATORS . . MOTORS . . MECHANISMS
by Bendix-Pacific

for MISSILES, ENGINES and AIRCRAFT

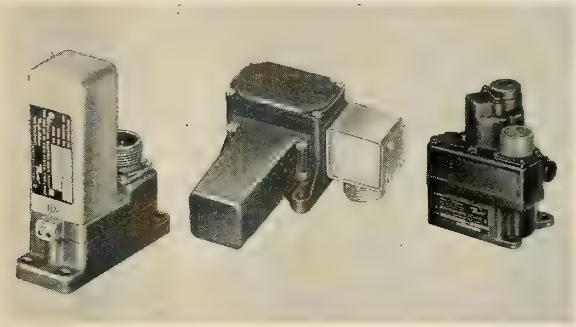
There are two requirements designed and manufactured into every Bendix-Pacific product — better performance and highest quality. You can rely on Bendix-Pacific Electro-Mechanical products to satisfy you on both these counts. In addition, these are rugged, high temperature units available for rapid delivery in any quantity.

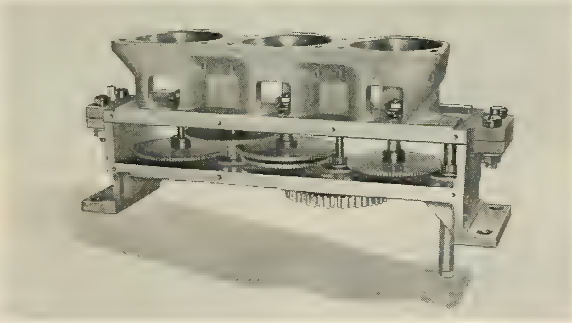
Bendix-Pacific also offers complete manufacturing facilities for quantity mechanical and electro-mechanical products to your own drawings.



MOTORS

Bendix-Pacific airborne quality motors include split series and shunt types with and without brakes. Typical size, 2″ x 1.20″ x 1.20″, for 1/25 HP intermittent duty.





ACTUATORS

Bendix-Pacific offers its complete line of quality Rotary Actuators including the exclusive Geneva-loc* Actuators, as well as Bendix-Pacific Timers, sequencing devices and override mechanisms.

MECHANISMS

Bendix-Pacific complete manufacturing facilities are available for quantity mechanical and electro-mechanical products to your drawings.

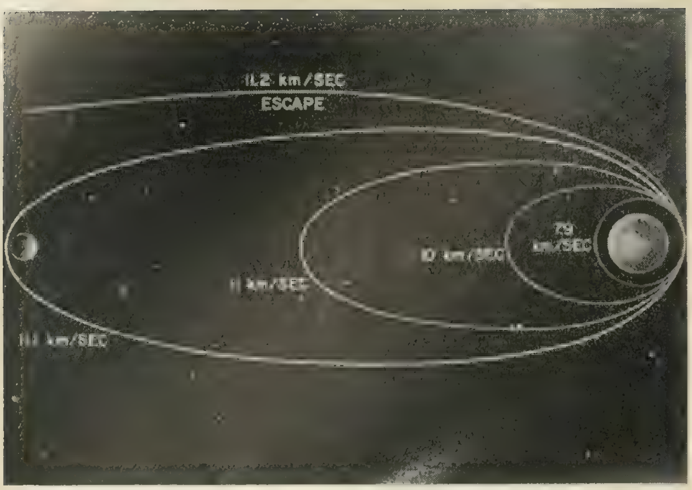
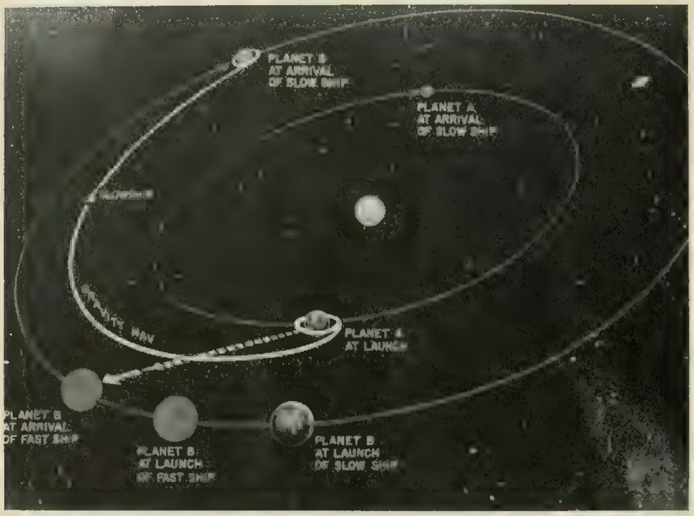
Guidance and Control in Space

The pictures and text on these pages were prepared from material used in training courses for Westinghouse Air Arms Division engineers by Dr. Peter A. Castruccio, Advisory Engineer.



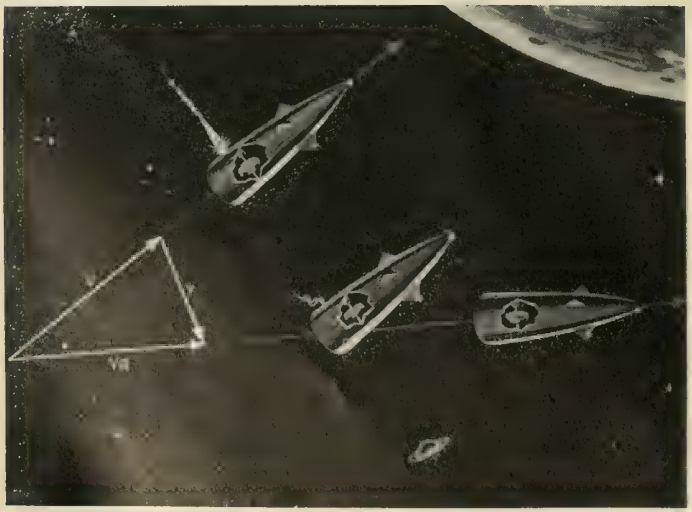
11.2 km/SEC
ESCAPE
7.9 km/SEC
10 km/SEC
11 km/SEC
11.1 km/SEC

The drawing (top left) represents velocities required of a space vehicle for achieving various elliptical orbits between the earth and moon and beyond. The 11.1 km/sec figure represents the velocity for sending a pay load to the far side to the moon. It should be noted that only a 1 per cent increase will produce escape velocity.

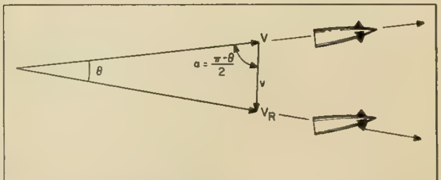


PLANET B AT ARRIVAL OF SLOW SHIP
PLANET A AT ARRIVAL OF SLOW SHIP
SLOW SHIP
GRAVITY NAV
PLANET A AT LAUNCH
PLANET B AT ARRIVAL OF FAST SHIP
PLANET B AT LAUNCH OF FAST SHIP
PLANET B AT LAUNCH OF SLOW SHIP

(Left) chemical propellants limit inter planetary flights to elliptical trajectories. By utilizing the velocities of departure and the gravitational attractions of the sun, flights paths for intercept with the arrival planet can be calculated. A fast ship utilizing continuous thrust could make almost a straight line intercept with the arrival planet.



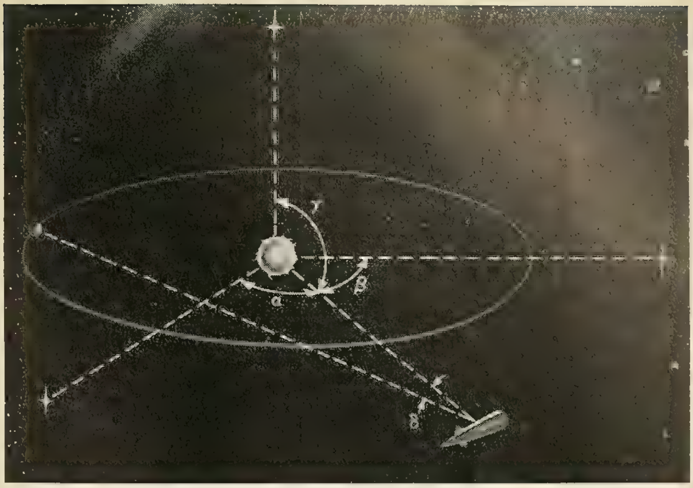
(Left) once a vehicle is in space, the problem of changing its course created complexities. To change direction of travel, (below) small rockets thrusting normal to the ship's horizontal axis are required.

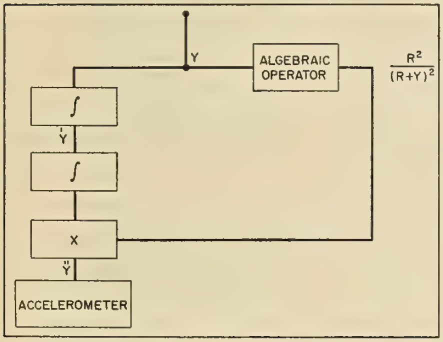


V
θ
$a = \frac{\pi - \theta}{2}$
v
V_R

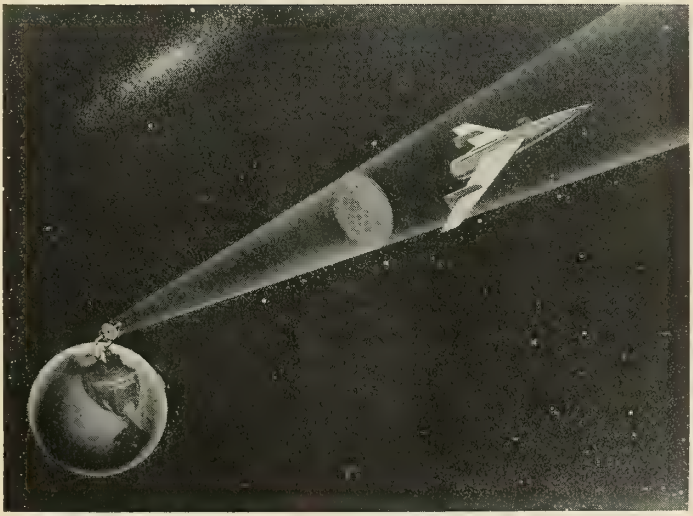
IF THE TRAJECTORY MUST BE DEFLECTED BY AN ANGLE θ, THE CORRECTING SPEED MUST BE $v = 2V \sin \theta/2$
THE CORRECTING THRUST MUST BE ORIENTED AT AN ANGLE $\frac{\pi - \theta}{2}$ TO THE INITIAL VELOCITY

Instantaneous knowledge of vehicle's position in space is of paramount importance to navigation. This must be achieved by Celestial Reference: sightings are made on three stellar bodies, in addition to the sun. An azimuth shot is then made of a planet in the earth's solar system to determine ships position with respect to the known positions of the sun and planet.

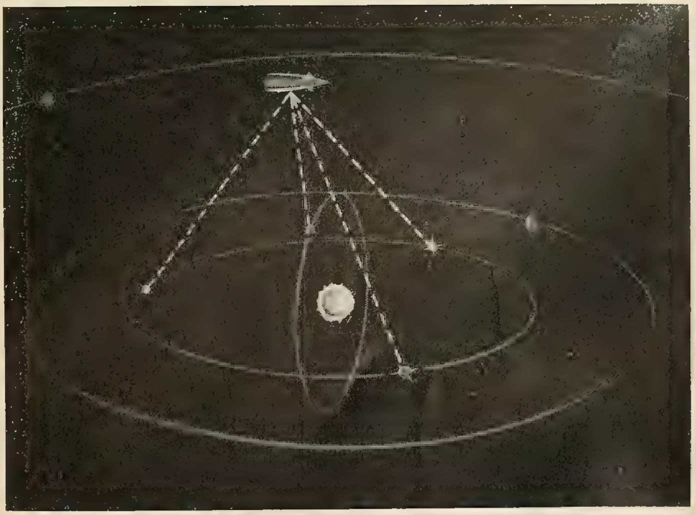




(Top) one method of navigation is through inertial guidance or IDR (Inertial Dead Reckoning). By integration of the output reading of an accelerometer, which in turn is fed into a computer, the velocity and the distance traveled is obtained.



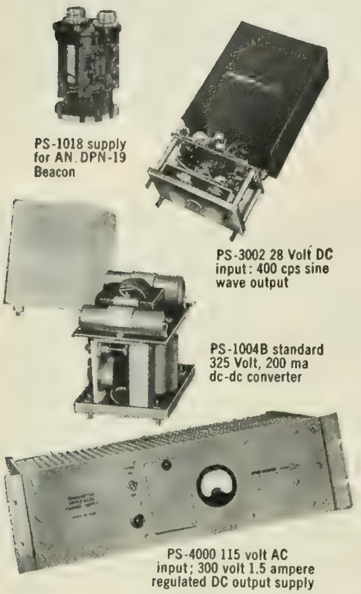
A method of guidance (right, center) developed by Westinghouse Air Arms Division is referred to as the Cooperative Optical System or optical projection method. When on course the ship instruments will receive a "white" color signal. Any deviation from flight path will result in a color signal.



Radio satellites or more properly revolving planetoids orbiting about the sun would provide an accurate method of interplanetary guidance. Three of the planetoids would travel in one orbital plane with the fourth planetoid traveling in a plane as near 90° from the first plane as possible. Measurements of the distance of arrival of the planetoids signals with relation to space ship will provide a fix on the ship's position.

Military reliability in

SEMI-CONDUCTOR POWER CONVERTERS



PS-1018 supply for AN/DPN-19 Beacon
PS-3002 28 Volt DC input: 400 cps sine wave output
PS-1004B standard 325 Volt, 200 ma dc-dc converter
PS-4000 115 volt AC input; 300 volt 1.5 ampere regulated DC output supply

Power Sources units are now in production missiles

Complete range of sizes, types and capacities for military and commercial requirements:

★ DC to AC available in any power up to 1500 watts . . . square or sine wave output.

★ AC to DC available with voltages up to 500V, and currents to 3 amps . . . DC Regulation to 0.1% . . . Impedances to .05 ohms . . . Over-all efficiencies 70-75%.

★ DC to DC available in combinations of the DC to AC and AC to DC ratings shown above.

★ Military Reliability is assured by extremely conservative designs and the use of the best, pretested military grade components and advanced semiconductor techniques. Meet MIL-E-5400 and MIL-E-8189.

Space Medicine

by **Hubertus Strughold, M.D., Ph.D.**

The fundamental purpose of studies in space cabin simulators, such as the seven-day test in February at the School of Aviation Medicine, is of a biotechnical and biomedical nature.

The biotechnical task is to test a sealed cabin, equipped with air-regenerating devices, as to its capability to keep a man alive and alert over a longer period of time. The biomedical side of the experiment includes the physiological study of the best kind of simulated, artificial atmosphere, the question of the best pattern of day-night cycle, and the psychology of isolation and confinement.

In the language of ecology and logistics, it is the aim of these studies to attain an optimum of comfort for the occupants, a maximum of efficiency of the air-regenerating and controlling devices, and a minimum of volume and weight. That not all conditions encountered in space flight can be simulated in such a ground-based simulator is generally well understood.

Komsomol Pravda has reported that Soviet scientists at a laboratory in Baboshkin near Moscow were developing a wing-flapping machine called an ornithopter, and that a demonstration of it had proven "unusual efficiency." The model craft has a 1-to-1½ horsepower engine and can lift 165 pounds. This would probably be about 180 English pounds.

This is interesting in the light of the long debate as to whether the human body—with its muscles as a power plant—could do that job, as first suggested by Leonardo da Vinci, and discussed by the physiologists Borelli in 1680 and Von Helmholtz in 1873.

To fly with his own muscle power, a man weighing 68 kilograms—with flight equipment weighing 108 kg—has to produce 2 horsepower. Under optimal machine technological conditions, the work could be decreased to about 1 horsepower.

But from studies in modern muscle physiology, we know that a strong man can produce only 15 mkg/sec or ⅕ horsepower for longer periods of time (higher output is possible for a very short time). A sprint runner may produce 5 horsepower. A race rower may produce 1.8 horsepower for 10 minutes. Long-distance runners and rowers can reach not more than 0.3 horsepower in one hour of work.

If we assume ⅕ horsepower as a possible maximum for a longer period of time, horizontal flights would require a 5 to 6 times higher energy output than a strong man can produce.

It might be possible, by improving the aerodynamic efficiency of a flapping-wing craft, to reduce the energy output required from 1 to ⅗ horsepower. In this case, short hops are conceivable.

In 1938 in Berlin, an aeronautical engineer demonstrated a wing-flapping device to me. For an explorer on Mars with reduced gravity (48%), and assuming the same air density and composition as on earth, it would be quite easy to fly around with musclepower. The Russian method attempts to replace the musclepower by a motor about six times as high in energy output than the musclepower of a strong man.

in this line-up . . .

there's a specific *Lapmaster*® to give you:

1 ***Precision Flatness***

2 ***Precision Finish***

in production quantities

Parts large or small—tall or squat—whatever the case may be, there's a Lapmaster tailor-made to meet your production requirements at the lowest possible cost per piece.

If you are now lapping by other means—hand scraping or grinding—it will pay you to investigate the Lapmaster. Our fully equipped lapping laboratory is at your disposal to analyze your problem, test run a number of pieces and furnish you with a complete production report without obligation.

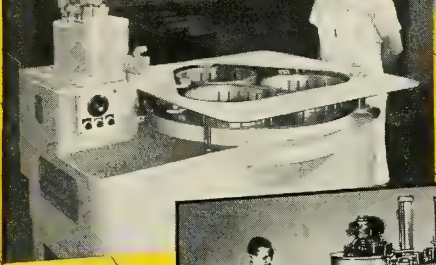
"John Crane" Lapmasters are capable of consistently producing flatness to less than one light band (11.6 millionths of an inch), micro-inch finishes of 2 to 3 RMS on all materials including cast iron, steel, magnesium, aluminum, brass, carbon, ceramics and plastics.

Crane Packing Company, 6476 Oakton St.,
Morton Grove, Ill. (Chicago Suburb).

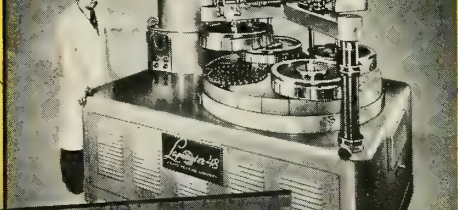
In Canada: Crane Packing Co., Ltd. 617 Parkdale Avenue, Hamilton, Ontario.

Model 12 handles 3 4-in. dia. parts up to 705 ¼-in. dia. parts per load.

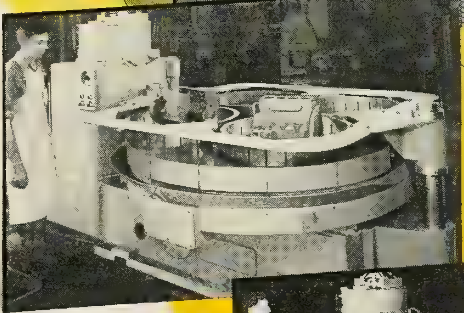
Model 24 handles 3 9½-in. dia. parts up to 3900 ¼-in. dia. parts per load.



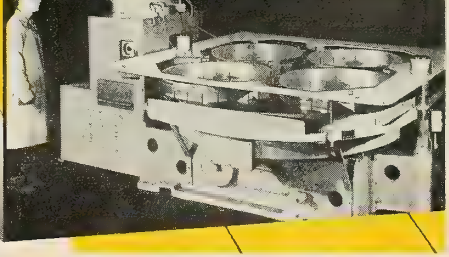
Model 36 handles 4 13¾-in. dia. parts up to 4000 ⅜-in. dia. parts per load.



Model 48 handles 4 17-in. dia. parts up to 940 1-in. dia. parts per load.



Model 72 handles 4 27-in. dia. parts up to 2480 1-in. dia. parts per load.



Model 84 handles 4 32-in. dia. parts up to 3500 1-in. dia. parts per load.

World Astronautics

by **Frederick C. Durant III**

The "Mars jars" at the USAF Department of Space Medicine (Randolph AFB, Tex.) are attracting increased interest. Samples of sandy soil from Arizona's Painted Desert are sealed in quart jars in an approximation of Mars' atmosphere. Atmospheric composition, humidity, surface temperature cycles, etc. are based on the best estimates of astronomers. First results indicate some microorganisms die quickly while others multiply easily under simulated Martian conditions. Related studies in the field, known as astrobiology, have been reported in French and Russian literature.

Readjustment problems—While intensive effort is underway to relate the capabilities and functions of "man on earth" with those of "man in space," Dr. Hubertus Strughold has suggested that another area of study will necessarily develop. This he terms "man back from space." Dr. Strughold pointed out recently that humans exposed for extended periods in a space capsule may find it difficult to readjust to terrestrial life. Once the physiological and psychological effects of weightlessness and "detachment" of space flight have become "normal," a period of time may be necessary for readjustment.

Another problem may be possibly dangerous strains of bacteria or viri indigenous to Mars which a terrestrial visitor might unwittingly bring back with him. This potential hazard will probably require quarantining upon return to earth. Dr. Strughold points out that such thinking is without practical application today. However, so was professional consideration of space medicine 10 years ago.

Updated—A few months ago an estimate was made in this column of the totalized period of weightlessness experienced by USAF pilot Maj. Herbert D. Stallings. The figures given were long out of date. Maj. Stallings told me recently that he had logged more than 37 hours of zero g during 4000 test flights in parabolic arc flight paths.

New light or speed of light—Those persons interested in relativistic effects of space vehicles traveling at speeds approaching the velocity of light should note a recent report from AFMDC at Holloman AFB, N. M. The paper, entitled "Relativistic Treatment of Rocket Kinematics and Propulsion" (No. AD-135004), examines reception and expulsion of particles including photons, in classical and relativistic cases. Optimization of a vehicle's final velocity is determined as a parametric function of available energy and final mass. Authors P. F. von Handel and H. Knothe conclude that exhust velocities must be increased 100,000 times to enable a vehicle to approach the velocity of light. Furthermore, the effect of relativistic time dilatation becomes noticeable only when traveling about 2/3 light velocity or more.

Surprising Accuracy—Because of its small size, it was anticipated that *Explorer* I might never be viewed optically. However, establishment of the orbit by the "microlock" telemetry system was so accurate that three U.S. Moonwatch teams made sightings within two days after launching.

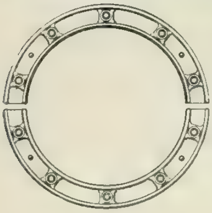
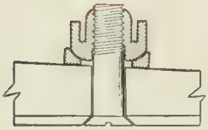
How ESNA® solves 7 typical aircraft fastening problems



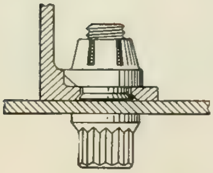
Speedier installation of access panels

ESNA gang channel nut strips eliminate the costly, time consuming installation job of riveting individual nuts. Available in straight or curved sections and even complete rings, custom designed for applications such as access doors or inspection covers.



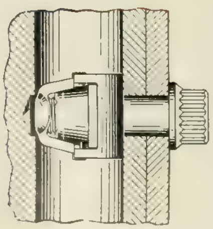
Bolting non-parallel surfaces

No more costly spot facing, step milling or hand selecting tapered shims! ESNA's counterbored, self-aligning types include one lug, two lug, gang channel, standard hex and high tensile types. Ball-and-socket relationship of nut and special base allow an 8° tilt in any direction from centerline to compensate for draft angle or tapered sections.



Fastening stressed joints subject to temperatures up to 1300°F.

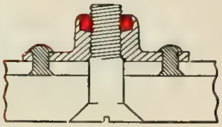
For really "hot" applications such as jet engine flange assemblies or fire wall sections, where fastener dependability is critical, ESNA offers the "long-beam" locking device. The full cantilever of these sections assures protection against failures related to relaxation, creep and similar problems caused by the effects of extremely high temperatures upon metals. **(Ask for ESNA Bulletin No. 5715 Design Manual for High Temperature Self-Locking Nuts.)**



Simplifying major substructure joining

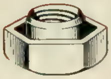
An ESNA barrel nut doesn't have to be held for wrenching . . . doesn't need precisely mated bolt holes. The barrel-shaped fastener, is simply finger-pressed into a drilled or reamed hole until the special clip snaps into position at the bolt hole location. The .030" float of the nut section of this fitting avoids misalignment problems and the bathtub recess for wrenching area is eliminated. New NAS 577 barrel nut (180,000 psi) now available. Also 160,000 and new 220,000 psi series.

ELASTIC STOP NUT CORPORATION OF AMERICA



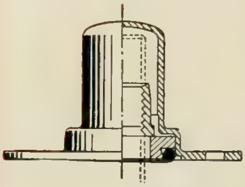
Applications requiring guaranteed high reusability through more than 50 on-off cycles.

Where repeated tear-down and re-assembly or frequent readjustment is required, the exceptional elastic "memory" and non-galling characteristics of ESNA's standard nylon locking insert guarantees long lasting locking torque and fastening dependability. Available in all sizes and configurations of standard aircraft type nuts. Parts can also be designed to order and in any standard configuration, with guaranteed re-use factors as high as 300 on-off cycles.



Attaching components in areas with limited wrench clearance.

Miniaturized insert-type hex nuts with across-the-flats dimensions as small as .109 in the 0-80 size . . . or all metal (550°F.) nuts to AN365 or NAS 679 performance specifications with internal wrenching hexagon faces (which permit use of smaller wrench sizes) are available for use at locations where space and weight limitations are paramount. Complete lines of NAS miniature anchor nuts in carbon steel and A286 stainless steel are also in production. **Ask for your copy of the NAS/ESNA Conversion Book.**



Sealing against fuel tank leakage

No danger of highly volatile fluids leaking past bolt threads with ESNA's self-sealing, floating anchor cap nut! The one piece cap unit is provided with "O"-ring seal around its base *which seals immediately the nut is riveted to the surface.* The self-locking nut enclosed within the cap has .025" float to compensate for misalignment. Also available in gang channel nut strips.

—WHAT ARE YOUR FASTENING PROBLEMS?—

Dept. N49-491, Elastic Stop Nut Corporation of America
2330 Vauxhall Road, Union, N. J.

Please send me details on the following:

- ☐ Installing access panels
- ☐ Sealing against leakage
- ☐ Fitting in limited space
- ☐ Bolting non-parallel surfaces
- ☐ Simplifying substructure joining
- ☐ Assuring high re-usability
- ☐ NAS/ESNA Conversion Book
- ☐ Bulletin No. 5715 High Temperature Design Manual

Space Talk In Spotlight

Wayne W. Parrish discussing missile production problems with ex-Air Force Secretary Senator S. Symington.

A missile in the making? Rolls Royce Ltd. Board Chairman James Pearson, missile-maker D. W. Douglas and RR Assistant Chief Engineer Dave Huddie, at reception given for Douglas by m/r publisher Parrish.

Also at the Air Force Association's Jet Age Conference was Convair's Krafft Ehricke, here being questioned by m/r's Norman Baker.

m/r editor Erik Bergaust recalls old times with Polar pioneer and industry consultant Bernt Balchen at the recent Jet Age Conference held in Washington, D. C.

SHERATON PARK HOTEL

At AFA Jet Age Conference, Ballistic Missile Division Chief, Maj. Gen. Bernard A. Schriever, (center) is flanked l. to r. by ATLAS manager Col. Otto J. Glasser and TITAN boss Col. B. P. Blassingame.

. . . People

J. V. Naish has been elected president of Convair Division of General Dynamics Corp., succeeding **Gen. Joseph T. McNarney.** He formerly acted as executive vice president of the division and now becomes senior vice president of General Dynamics as well as president of Convair.

Whitley C. Collins, president and chief executive of Northrop Aircraft, Inc., has been elected a member of the Board of Trustees of the California Institute of Technology.

Dr. Alfred H. Williams has been elected to the board of directors of the International Resistance Co. Dr. Williams is currently chairman of trustees, University of Pennsylvania and previously was president of the Federal Reserve Bank of Philadelphia.

James Cox has been elected executive vice president and **Paul W. Booth** as vice president in charge of engineering at Hoffman Laboratories, Inc.

Dr. E. M. Baldwin has been appointed general manager of Fairchild Semiconductor Corp. He will also serve as vice president and member of the board of directors.

Lee S. Busch, technical director for Mallory-Sharon Metals Corp., has been reappointed to NACA's subcommittee on power plant materials.

Herbert Harris, Jr., has been appointed manager of Sperry Gyroscope Co.'s Air Arm Division. He formerly was chief engineer for the division. Simultaneously, **Edward M. Brown** was named treasurer of the firm.

Dr. George L. Haller has been elected a vice president of General Electric Co. Since 1956 he has served as general manager of GE's Defense Electronics Division.

Johannes G. Schaberg has joined Control Data Corp. as a staff engineer. He will have senior responsibility for the company's activities in missile guidance systems development.

Leonard K. Schwartz has been named a vice president of Hughes Tool Co. Since 1940, he has been with Lockheed Aircraft Corp. His specific duties with Hughes have not yet been announced.

Dr. James F. Jenkins, Jr., has been appointed director of development at Interstate Electronics Corp. He is responsible for direction of major projects involving missile test and evaluation instrumentation.

W. L. Smith has been named sales manager of Products Research Co.'s newly created Aviation Division, producer of sealants.

S. D. Heller has been appointed to the newly created post of vice president, Ballistic Missile Early Warning System of RCA Service Co. At the same time, **K. M. McLaren** assumes the post of vice president, missile test project, succeeding Heller.

Frederick Stevens has been named to head the electronic systems and equipment facility of Northrop Aircraft, Inc. and **Thomas H. Quayle** will head the firm's systems support facility, formerly designated Northrop-Anaheim.

Anthony J. Randazzo has been appointed manager of the Packard-Bell Electronics Corp.'s Rome, N. Y., office.

David M. Kyllonen has been appointed technical manager of the Muskogee, Okla., Division of Callery Chemical Co.

Major Bill R. Nash, formerly with Headquarters, ARDC, has joined the Washington firm of Thomas Wilcox Associates, consultants to the missile industry.

Ross F. Miller has been named chief engineer of Nortronics electronic systems & equipment elements.

R.C.Allen RATE GYROS

DESIGNED TO YOUR REQUIREMENTS

DAMPED
VERSATILE
PROVEN IN FLIGHT
LOWER COST

Wherever your aircraft and missile planning calls for a rate gyro, specify R. C. Allen . . . proven in flight countless times over. Prototypes are designed to your specific requirements and sent on consignment for your evaluation. Volume production facilities are under strict air pressure and cleanliness conditions. R. C. Allen damped rate gyros meet environmental specifications of MIL-E-5272A. Require no heater for damping from .2 to 500 times critical, with temperature compensation from ⁻55°C to ⁺80°C. Small, efficient, hermetically-sealed and sturdy. Write or call for complete information.

TURN AND BANK INDICATOR
STANDARDIZED FOR LOWEST COST

Always specify standard R. C. Allen Turn and Bank Indicators, built under most rigid quality control according to government specifications MIL-I-7805, MIL-I-7805A, MIL-I-7627A, and MIL-I-5488, and to CAA TSO-C3a. AS395.

Non Aging—ready for instant service at any time, whether measured by clock or calendar—that's medium and high pressure Fluoroflex®-T hose fabricated from a compound of Teflon® resins. Working life is unlimited for practical purposes.

Permanent reliability is *assured* by a manufacturer with *complete control of hose production,* as well as fitting and assembly fabrication. It is *confirmed* by use on virtually all liquid fuel and many solid fuel missiles produced to date ...*proved* by years of in-flight service on military and commercial aircraft.

Handles the most corrosive fluids at temperature extremes, including the exotic fuels. Fluoroflex-T hose assemblies are ideal for use in launching and fueling systems as well as in the fuel and hydraulic control systems—up to 3000 psi. Their slender silhouette and compact fittings conserve valuable space in confined missile envelopes.

Vital Facts About Teflon. End properties of products made from Teflon powder can change significantly with even minor or accidental alterations in processing. Your best guarantee of absolute reliability is the manufacturer's experience. Specify Fluoroflex-T for the hose that's backed by unequalled experience in fluorocarbon hose.

This 64-page aircraft plumbing handbook gives detailed information on Fluoroflex-T hose and hose components. It's available on request.

® Fluoroflex is a Resistoflex trademark, reg., U.S. pat. off.
® Teflon is DuPont's trademark for TFE fluorocarbon resins.

INTER-OFFICE MEMORANDUM

To Advertising Department Subject Recruitment Advertising for Engineers

From Vice President - Engineering

As the result of expanding activity in recent months, we have come up with a few openings for good engineers. Specifically, we need designers in the following product groups:

Pneumatic accessories
Electric motors
Fuel systems controls (pumps and valves)
Hytrol anti-skid braking system (electro-mechanical)

The requirements are not pressing: our present team can still carry the increased load. We're proud of the boys we now have, and it's important that we find exactly the right people to add to the group. Therefore, before you rush into print with the usual sort of "recruitment" advertising, here are some thoughts to use in formulating your message:

1. We don't hire engineers by the carload, and we don't stockpile them in reserve until the right project happens to come along. Our people are busy...very busy; and they like to be busy. They follow through on their ideas from inception to development and qualification. They feel a real responsibility for the hardware that finally results from their work. Therefore, we need more idea men with initiative and drive who are not afraid to get their hands dirty.

2. Don't write a lot of guff about "security" and "bright future." The kind of men we want carry their security around with them. They have the self-assurance that comes from ability and experience. Chances are they've known about our company for several years and have followed our progress in the industry. If they answer our ads, it means they like us - and they think they can help us to grow.

3. The kind of man we want will join us because we treat our engineers in the same way we treat our other key people. We don't isolate them and we don't put them on pedestals. We expect results; we know how to look for results; and we reward amply when we find them.

One other point: the man who meets our requirements is probably too busy to write a long resume and application letter. Just tell him to call me personally, or to drop me a short note to let me know where I can contact him - to Hydro-Aire, Inc., 3000 Winona Avenue, Burbank, California.
Phone: VIctoria 9-1331.

Frank Cooper
Vice President -
Engineering & Sales

FRC:mk

West Coast Industry

by Fred S. Hunter

Security costs money in the missile business. Lockheed's guard force for its California Aircraft division totals 150. The guard payroll at its missile systems division, already up to 200, is growing. Lockheed soon learned it needs two shifts of guards, even though only one shift is being worked. Seems the men who design and develop missile systems and missile components have the habit of working freely on their own time. This idiosyncrasy of showing up to work during nonworking hours requires added guard shifts to check 'em in and out.

"Mounties" in California—And, speaking of Lockheed's guards, would you believe that its missile systems division has a mounted force? Yep, on horseback. These mounted guards patrol the new 4000-acre Santa Cruz Mountains test site. This is a wooded area, so the guards double as rangers, spotting forest fires and the like. And in the hunting season they also keep a lookout for men with guns, who might venture into the area by mistake. Lockheed wouldn't want one of its missile experts mistaken for a deer.

Bright-eyed engineers at Radioplane have been using their coffee break and lunch time to theorize over a launching system that would send the grainstorage tanks of the nearby Budweiser brewery into outer space. Not only has their thinking reached the point where they believe it can be done, but a second group (equally bright-eyed) are certain they have a satisfactory recovery system devised. Naturally, it's called project *Hopnik.*

Boron into space: Kern County Land Co., rich old California cattle, oil and land organization, which recently made an investment in electronics, may also share in the new space age through its boron holdings. Reports put its Mojave Desert reserves at about 40 million tons. That would be the second largest known deposit of boron. U.S. Borax & Chemical reserves total about 100 million tons.

Reports around Los Angeles have it that North American Aviation definitely has submitted follow-on proposals on the X-15 to the Air Force to put an unmanned version into orbit, using the big three-barrel, 400,000-lb.–thrust rocket booster developed for the defunct *Navaho*, then a manned orbital version, and finally a piloted *X-15* to circle the moon and return.

Sample of the dynamic nature of the missile industry: Aerojet-General Corp. is a subsidiary of General Tire & Rubber, but not wholly owned. There's Aerojet stock currently selling around $300 a share in the over-the-counter market. As recently as 1954, it was selling for around $25 a share. Aerojet sales of $2.5 million in 1946 zoomed to $162 million in 1957, and that's a rate of climb equalling its own rockets.

4 Ounce Contact Force Makes Relays More Reliable

Contact force of 4 ounces per contact on 50 "G" models and 2 ounces per contact on 30 "G" models of "Diamond H" Series R and Series S miniature, hermetically sealed, aircraft type relays is one of the most important factors in their proven high reliability.

Though absolute reliability of any similar device is impossible to guarantee—a bitter fact of life recognized by all electronic engineers—close approach to this goal by the relays manufactured by The Hart Manufacturing Company is the basic reason they are found today on many of this country's headline-making missiles.

In addition to contact force far beyond that found on other relays, "Diamond H" relays have greater contact cleanliness. Self-contamination is virtually eliminated by a completely inorganic switch mechanism, as well as use of coil materials which will not dust, flake or out-gas.

Finally, the high degree of reliability that is designed into these relays is maintained in their manufacture by high quality workmanship and a stringent inspection policy at every stage.

In addition to missiles, and their ground control systems, Series R and S relays are designed for use in jet engine controls, computers, fire control, radar and similar critical applications.

4PDT units, they offer an extremely broad range of performance characteristics, including temperature ranges from —65° C. to 125° and 200° C.; ratings to 10 A., 120 V., A. C., and 26½ V., D. C., with special ratings to 400 ma. at 350 V., D. C., or down to millivolts and milliamperes. Dry and wet circuits may be safely inter-mixed.

For more information, write today for Bulletins R250 and S260. For quick facts about "Diamond H" switches, thermostats and other devices, ask also for a copy of the "Diamond H" Check List of Reliable Controls.

OPERATIONS RESEARCH
The Denver Division of the Martin Company

has positions available for engineers and scientists with several years of weapons system or operations research experience in the areas of missile requirements; evaluation and advanced design. Work assignments will include analyses of ICBM weapon systems from research and development through production and test to operational employment.

Basic Requirements are:
1. Degree in physical or engineering sciences.
2. Strong career orientation toward weapon system or operations research.
3. Ability to work with a diversified team.
4. Proven ability to generate ideas and isolate specific problem areas.

Interested and qualified candidates are urged to send a resume complete with education, work experience (including details of work for which candidate was personally responsible) salaries earned and professional ambitions to:

Soviet Affairs

by Dr. Albert Parry

Russian researchers are cautiously talking of one interesting project of theirs: the use of lightning as a smiting weapon.

Creating artificial lightning, and adding it to the Red war arsenal as a weapon against enemy planes, is a novel Soviet idea. Experiments along this line are currently carried on in laboratories at Moscow and Leningrad.

The objective is ball or globe lightning, rarer than forked or zigzag and sheet or heat lightning.

In general, ball or globe lightning has not been as well understood as the other types, and has always intrigued Russian scientists. In the early 1940s scientist George Babat experimented with such lightning and finally succeeded in creating it artificially in the laboratory attached to the Leningrad *Svetlana* Plant.

Babat's work was continued by Professor Peter Kapitsa, one of Russia's foremost atomic-and-hydrogen, rocket-and-missile specialists, who in the 1950s took over Professor Babat's work and improved upon it with his own genius.

Kapitsa came up with his hypothesis as to the physical laws of the origin of natural ball lightning, and this hypothesis is considered by Soviet science to be a great step forward in creating and guiding artificial ball lightning.

Officially, the Soviets declare that they would use artificial lightning for peaceful uses only.

A Soviet technical writer, N. Dolgopolov, recently remarked that such lightning "would with extraordinary speed cut into the ground and form mining shafts with solid, streamlined walls," making Russian ore-mining a fabulously speedy and most economical process, and sure to cause a veritable revolution in the world's mining generally.

But unofficially, the Soviets are also considering ways and means of using artificial ball or globe lightning against enemy planes.

A team of Kapitsa's and Babat's students are now closely studying known cases of accidental "bull's-eye" hits of Soviet planes in flight by natural ball lightning, and they are drawing certain conclusions from this study. A case involving such a hit near Komsomolsk in the Soviet Far East in August 1956, when a Soviet air transport miraculously survived a bolt of globe lightning, is considered particularly fruitful.

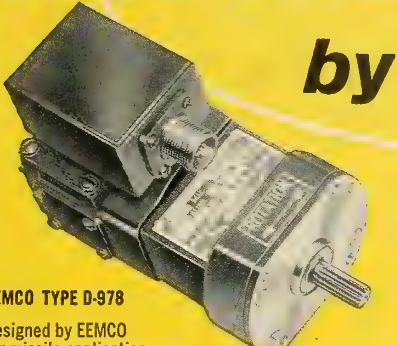
More frankly—and with much authentic technical detail—the future possible use of artificial globe lightning against enemy airplanes is described in at least two works of Soviet science fiction.

Now, globe or ball lightning strikes men and their machines with a totally blind fury. But the Soviets want to harness this fury, to make it "see," to guide it as a truly terrifying, demoralizing, and shattering missile against definite targets—against whatever enemy faces the Soviets in the air in case of war.

Four new

MOTORS for MISSILES

by EEMCO

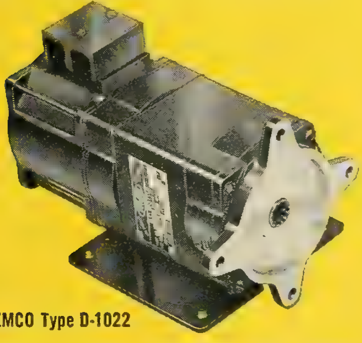


EEMCO TYPE D-978

Designed by EEMCO
for missile application
where prolonged testing is required under full load at a temperature range of +180° F. to +400° F.

SPECIFICATIONS: Volts: 27 volts DC (24 to 32 volt range). **Horsepower:** ¼ HP (⅔ HP max. short time overload). **R.P.M.:** 12,000. **Weight:** 2.75 pounds. **Miltary Specifications:** Radio noise filter meets MIL-I-6181B. Explosion proof requirement meets MIL-5272A-Proc. 2. **Altitude Operation:** Tested successfully at over 200,000 feet altitude. **Features:** Built for high shock and vibration loading.

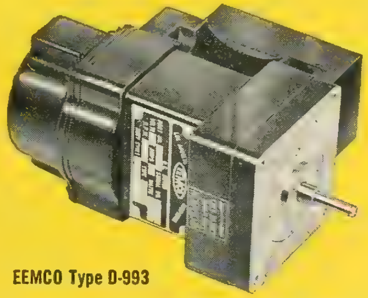
To design and produce motors for missiles that perform well beyond the limits of military specifications yet which maintain specified size and weight limitations is a constant objective at EEMCO. The design, development and testing of motors that achieve these extreme performance characteristics requires EEMCO to conduct company-financed independent research far beyond that normally conducted by a manufacturer of its size. In many instances EEMCO has been able to meet rigid specifications, in fact exceed them, when other producers have failed. For example, three of these extremely rugged new EEMCO motors illustrated will perform with reliability in the atmospheric conditions encountered at altitudes in excess of 200,000 feet, and they are built for unusually high shock and vibration loading. Please note the outstanding capabilities of the individual motors shown.



EEMCO Type D-1022

Designed by EEMCO for extremely high altitude operation with ambient temperature capacity to 165° F. Type D-1022 is capable of unusually high shock and vibration loading.

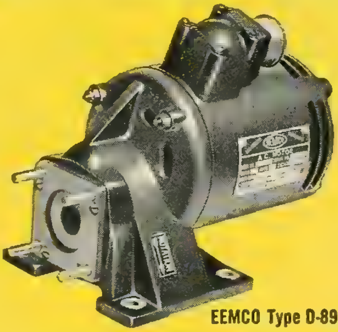
SPECIFICATIONS: Volts: 56 volts DC. **Horsepower:** 8.5 HP at 85% efficiency. **R.P.M.:** 12,000. **Duty cycle:** Two minutes. **Ambient temperature:** 165° F. **Weight:** 14.75 pounds. **Military Specifications:** Explosion proof requirement meets MIL-5272A-Proc. 2. **Features:** Built for high shock and vibration loading.



EEMCO Type D-993

Designed for missile applications where prolonged testing is necessary. Type D-993 will stand long idling periods with intermittent loads up to 1.25 HP. It is capable of withstanding vibrational accelerations of up to 125 "G's" in a frequency spectrum of 30 to 300 cycles per second.

SPECIFICATIONS: Volts: 28 volts DC (24 to 32 volt range). **Horsepower:** .65 HP. **R.P.M.:** 9600 RPM. **Weight:** 6.2 pounds. **Military Specifications:** Radio noise filter meets MIL-I-6181B. Explosion proof requirement meets MIL-5272A-Proc. 2. **Altitude Operation:** Tested successfully at over 200,000 feet altitude. **Features:** Built for high shock and vibration loading.



EEMCO Type D-899

Rated at 2.75 HP on continuous duty, EEMCO Type D-899 200-volt 400-cycle 3-phase motor is made with high temperature insulation allowing continuous operation at 3.5 HP or a correspondingly high ambient. D-899 contains an integral gear box.

SPECIFICATIONS: Volts: 200 volts, 400 cycle, 3-phase. **Load:** 2.75 HP continuous duty. **R.P.M.:** 3140 RPM. **Power Factor:** 83%. **Overall Efficiency:** 76% for entire unit including gear box. **Military Specifications:** Meets MIL-M-7969A (ASG). **Weight:** 11.25 pounds. **Features:** Type D-899 may be made splash- and drip-proof with minor alterations. Gear box, acting as motor support, places base at approximately the center of gravity of a motor-pump assembly thereby limiting extreme shocks and vibrations encountered in a missile.

EEMCO HAS DESIGNED and produced motors and actuators for missiles and aircraft exclusively for the past 15 years. It has made nothing else. Exhaustive research and testing aimed at perfection in the art of building these units has been a constant objective since EEMCO was founded. As a result, extreme precision and reliability has been attained in its products; therefore many of the latest missiles and aircraft being developed and manufactured for our Armed Forces today contain EEMCO motors and/or actuators.

Your inquiry is invited.

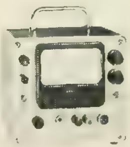
3KC CARRIER
SYSTEM



PORTABLE 3KC
CARRIER SYSTEM MODEL PCS-1

8 inches wide 6 inches deep
7 inches high Weight: 10 lbs.

Model PCS-1 is a single channel portable 3 kc carrier system designed for use with variable reluctance transducers: specifically, Northam absolute, differential and gage pressure pickups and accelerometers.

Specifications of Model PCS-1 call for a regulated excitation voltage output from the oscillator of 10 volts rms at 3 kc and a demodulator output current linearity of better than 1% full scale, providing 1.0 ma into 50 ohms. An auxiliary filter (Model F-1) provides a suitable output for oscilloscopes, oscillographs, strip chart and pen recorders. A signal is produced flat within plus or minus three percent from 0 to 250 cps. There is also an output jack to permit operation of a remote meter as another alternative read-out.

Write for Bulletin. Northam Engineering facilities are available to assist you in any application problems.

Missile Age

by Norman L. Baker

Acceleration of future production schedules for the *Titan* ICBM, and a major step-up in development of the X-15 research rocket plane are two projects certain to be included in the Defense Department extra-spending package for fiscal year 1959.

The X-15 program is suffering propulsion headaches: The 60,000-lb-thrust rocket engine under development by Reaction Motors refuses to come up to design thrust. Meanwhile, the X-15 test schedule calls for first glide tests this fall and first powered flights in early spring '59.

The Defense Department spent $16.5 million on rocket test stands at the Holloman AFB Missile Development Center, then halted the project and gave the go-ahead to construct IRBM and ICBM static test stands from scratch at other locations. With the Air Force in an all-out effort to corner all the space projects, Missile Development Center officials are confident that the center must receive a large share of the business.

Project Rover, a Los Alamos study to determine the feasibility of using nuclear power to propel rockets, is still in the research and development stage. During studies so far, various concepts have been evolved, and some have been promising enough to justify incorporating into detailed design studies. First tests of reactor systems at the Nevada test site are now scheduled for late this year. Flight tests of rockets propelled by a nuclear system are not expected for about five years.

Nike Hercules missile defense system has been supplied a needed boost with the award of two contracts totaling $129,592,706 to Western Electric for production of an undisclosed number of the missiles and the related ground equipment. Douglas will produce the missile and some of the support equipment. Chief subcontractors are Consolidated Western Steel Co., which makes launchers; Goodyear Aircraft Co., which makes the boost engines, and Borg-Warner Co., which makes parts for the booster.

The Air Force is reported to be highly pleased with the recent test of the *Thor* equipped with a General Electric Mark I operational nose cone. Production of the extremely flattened cone is now under way at General Electric's Missiles and Ordnance Systems Department in Philadelphia. *Thor* is now in the payoff phase of testing and Air Force officials are confident that deliveries to operational squadrons will be made on schedule.

The Russians are in a crash program to develop a manned, hypersonic rocket bomber that cannot be brought down by an anti-missile missile. The rocket bomber is expected to be operational by the time the *Nike Zeus* is developed. The hypersonic bomber has considerable lattitude in attack techniques and therefore is almost invulnerable to a conventional anti-missile missile.

charting physical properties of the atmosphere

AiResearch Assembles Latest
Standard Information in Working Form

THE CHARTS on the following pages present the latest recognized standard properties of the earth's atmosphere. Based upon the best available data, and representing over a year of research, calculations, and careful rechecking, the charts were created by The Garrett Corporation's AiResearch Manufacturing Division, Los Angeles, under the supervision of Frederick H. Green, Assistant Chief of Preliminary Design. The work was closely coordinated with the Geophysics Research Directorate of the Air Force in order to obtain the latest information.

In 1942, AiResearch created its first Atmosphere Chart, which showed the then-known properties of the atmosphere up to about 65,000 ft. This was extended in 1945 to 80,000 ft, and in 1948 to 100,000 ft.

This year, AiResearch is issuing two charts, the Atmosphere Chart and the High Altitude Chart. The Atmosphere Chart covers the range from sea level to 100,000 ft, which is the basic operating region for current air-breathing aircraft. With the advent of the space age, we are starting to crowd ourselves out of this region into the realm of the High Altitude Chart, which goes up to 2 million ft.

Two original paintings by Chesley Bonestell, the dean of American space travel illustrators, form the backgrounds of the charts. These incorporate a high degree of pictorial accuracy in the portrayal of terrestrial features, sky, and the various vehicles by which man has progressed in his conquest of space. This progress is illustrated in numerous record flights including the recent records of Captain Iven Kincheloe at 126,000 ft in a rocket aircraft and Major Simons' balloon flight of 102,000 ft.

Atmosphere Chart

The Atmosphere Chart presents accurate values of temperature, pressure, and specific weight of the air for altitudes up to 100,000 ft. From sea level to 65,800 ft, the columns on the sides and the white temperature profile in the center of the chart are based on the ICAO Standard Atmosphere, established by the International Civil Aeronautics Organization and adopted by the National Advisory Committee for Aeronautics. Above 65,800 ft, the data in the columns and the dashed portion of the central profile are taken from the U.S. Extension to the ICAO Standard Atmosphere and the ARDC Model Atmosphere, 1956, which are in agreement. In addition to the Standard temperature profile, curves are shown for the Hot and Cold atmosphere temperatures and for the arctic and tropical profiles. The pressure and specific weight values shown are consistent only with the ICAO temperature profile, but are usable with the other four temperature profiles.

The ICAO Standard profile represents an average temperature for latitudes within the Temperate Zone of the northern hemisphere. The Hot and Cold temperature profiles, based on Military Standard MIL-STD-210A, represent extreme temperature criteria for the design of military equipment. They do not necessarily represent the absolute extremes observed; rather they are the values determined by scientific judgment not to be surpassed more than 10 per cent of the time during the most extreme month.

The arctic and tropical profiles provide criteria for consideration in problems dependent upon a hydrodynamically consistent homogeneous polar (arctic) or tropical atmosphere. These atmospheres cover extreme latitude zones in the northern hemisphere. The arctic atmosphere presents a mean day in the 60 to 90 degree North latitude zone and the tropical atmosphere presents a mean day in the 0 to 20 degree North latitude zone.

High Altitude Chart

The High Altitude Chart presents properties of the earth's atmosphere up to 2 million feet. In addition to extending the specific weight and pressure scales of the Atmosphere Chart, the High Altitude Chart contains values of geopotential altitude, acceleration of gravity, molecular weight, and real kinetic temperature.

The scales are readily interpreted with a moment's study, but the reader should note that the values of specific weight and pressure on this chart appear in terms of negative exponents and decrease as one reads up these scales. Thus the shorter black graduations are related to the longer division mark immediately *above,* and not below, them. For example, the pressure at 1,460,000 ft is 5 x 10^{-11} inches of mercury. Also, the geopotential altitude scale is plotted in black graduations, while the basic geometric altitude scale is plotted in white graduations and diamonds.

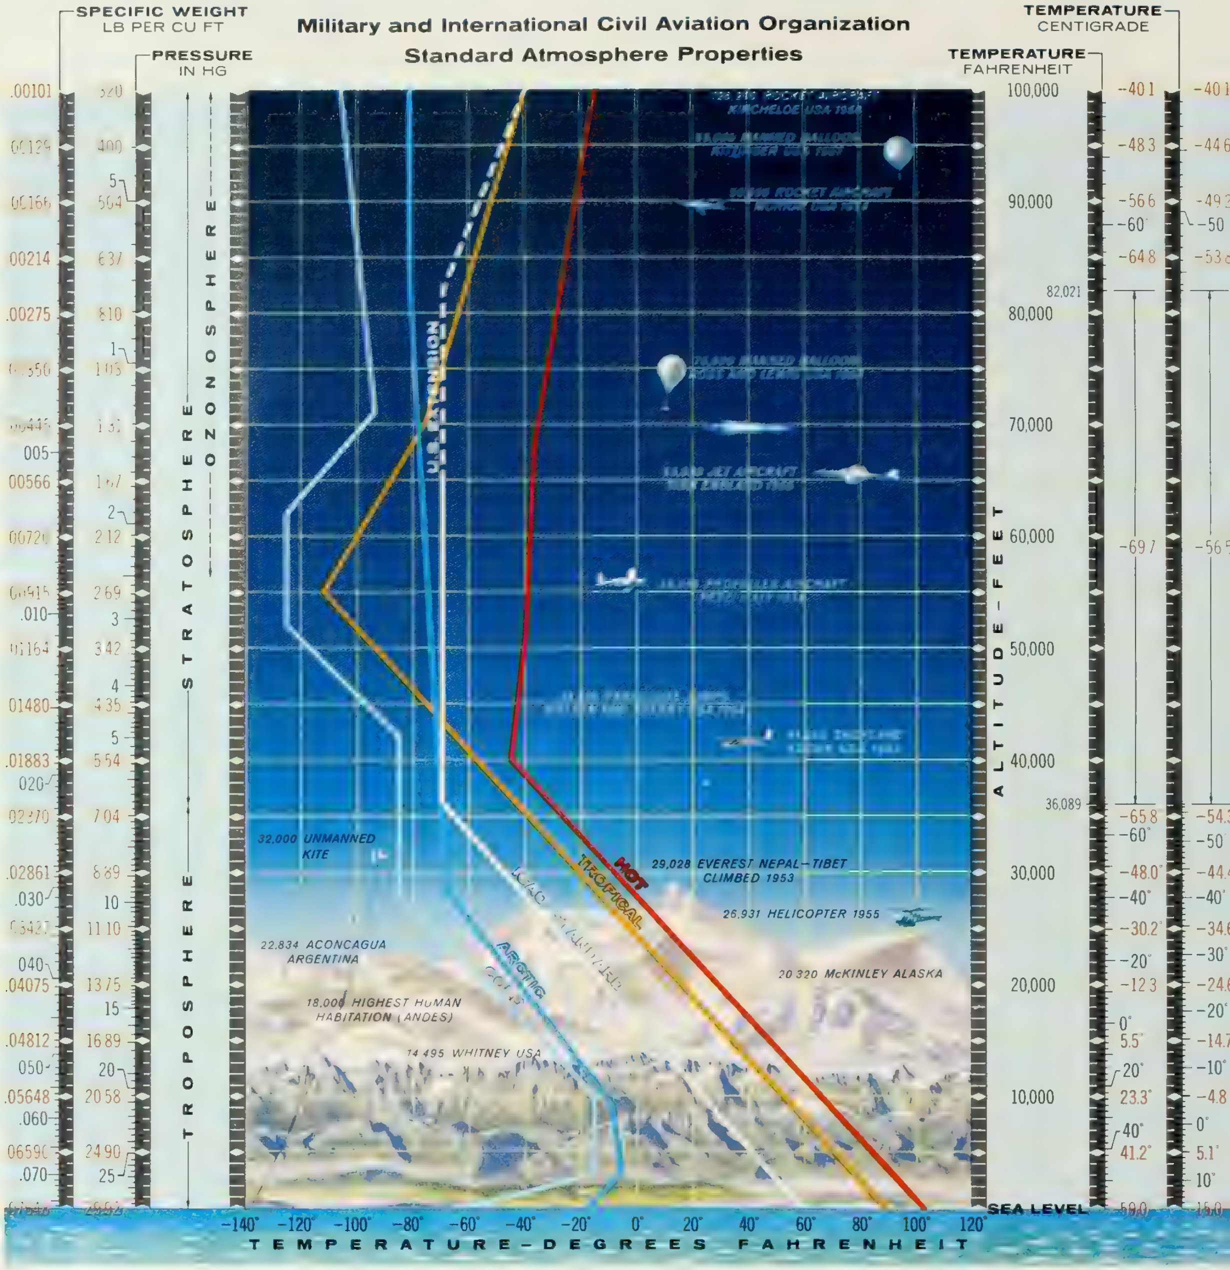
Real Kinetic Temperature

Real kinetic temperature, shown in the High Altitude Chart, is a measure of the kinetic energy of molecules and atoms constituting the atmosphere at any specified altitude. It is the appropriate temperature to be used in thermodynamic and fluid dynamic calculations, and is the same thing as the ambient

(continued)

ATMOSPHERE CHART

Military and International Civil Aviation Organization Standard Atmosphere Properties



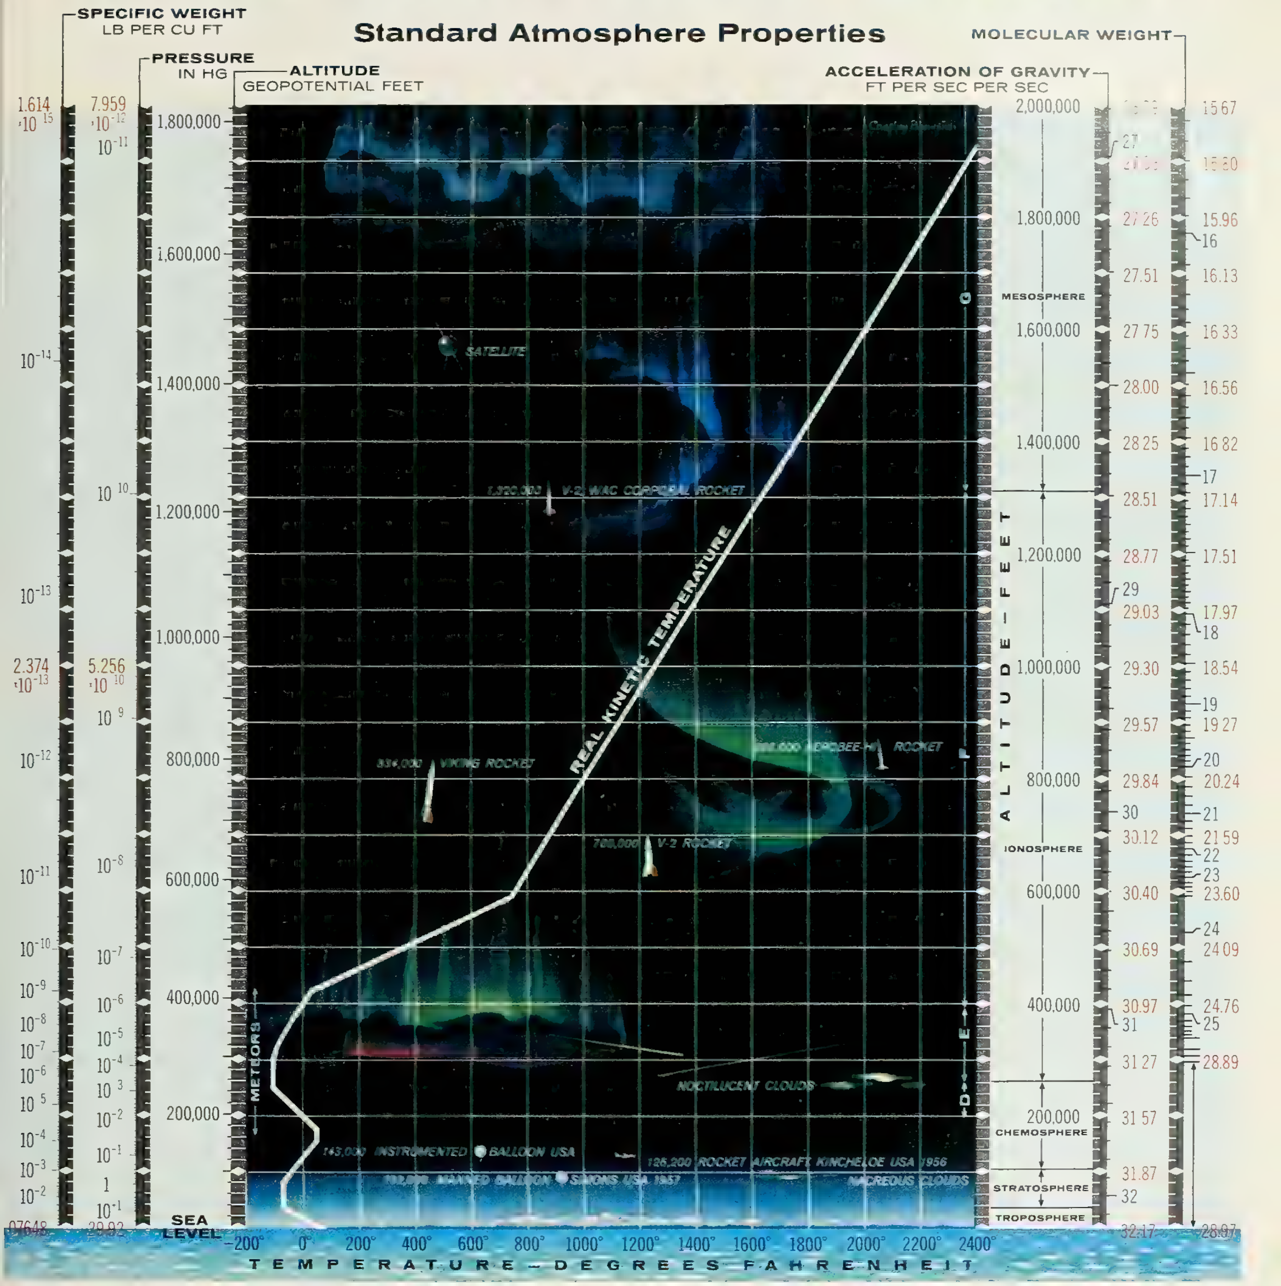
This chart presents the latest recognized standard values of temperature, pressure and specific weight of the air for altitudes up to 100,000 feet. The pictorial inserts represent steps in man's achievement in learning to reach and to exist at high altitudes. From sea level to 65,800 feet the columns on the sides and the central profile all refer to the International Civil Aviation Organization Standard Atmosphere. The NACA Standard Atmosphere, 1955, and the ARDC Model Atmosphere, 1956, are consistent with the ICAO Standard Atmosphere up to 65,800 feet. Above that altitude the data in the columns and the dashed portion of the central profile are taken from the U. S. Extension to the ICAO Standard Atmosphere and the ARDC Model Atmosphere, 1956, which are in agreement. The pressure and specific weight values shown are consistent only with the Standard temperature profile. The hot and cold profiles represent U. S. Military extreme temperature criteria. The tropical and arctic profiles represent U. S. Military homogeneous atmospheres for the tropical and arctic regions.

EDITOR'S NOTE: This chart was prepared by The Garrett Corporation's AiResearch Manufacturing Divisions as a service to industry and the military and is reprinted by Missiles and Rockets with The Garrett Corporation's permission as copyright owner.

© 1958 THE GARRETT CORPORATION

HIGH ALTITUDE CHART

Standard Atmosphere Properties



This chart presents standard values of temperature, pressure and specific weight of the air, based on the ARDC Model Atmosphere, 1956, for altitudes up to 1,780,465 feet. The altitude column on the right presents geometric altitude. The energy required to lift an object 2,000,000 geometric feet is only 1,824,988 times that required to lift it one foot above sea level, because of the decrease in the acceleration of gravity with altitude. This relative amount of energy is shown in the column on the left as geopotential altitude. Real kinetic temperature is a measure of the kinetic energy of the molecules and atoms constituting the atmosphere. Its numerical value is determined by the assumed molecular weight of air as well as the assumed temperature lapse rate. The molecular weight of air is assumed constant from sea level to 299,516 ft. Its decrease above 299,516 ft. to 590,401 ft. is attributed to the dissociation of oxygen; its decrease above 590,401 ft., to diffusive separation and dissociation of nitrogen. The symbols D, E, F and G refer to the respective ionized regions of the atmosphere.

EDITOR'S NOTE: This chart was prepared by The Garrett Corporation's AiResearch Manufacturing Divisions as a service to industry and the military and is reprinted by Missiles and Rockets with The Garrett Corporation's permission as copyright owner.

© 1958 THE GARRETT CORPORATION

static temperature referred to in current aircraft design work and coincides with that of the standard atmosphere shown in the Atmosphere Chart.

It should perhaps be noted that readings from the temperature curves will not in general indicate the temperature of any body suspended in or through the atmosphere. Both aerodynamic heating and thermal radiation must be considered in calculating body temperatures. In particular, at high altitudes the few molecules of air near an object have little effect upon the object's temperature, compared with the heating effect of the sun's radiation. And were the object stationary and in shadow, shielded from the sun's rays as well as from other sources of radiated heat, its temperature would approach absolute zero, scarcely affected by the molecular action of the rarefied air.

Direct, independent measurements of temperature have been made only at relatively low altitudes, below 143,000 ft. Above that altitude, conventional instrumentation on sounding rockets yields only the ratio of temperature to molecular weight. Molecular weights have been measured only to about 300,000 ft so that "measured" temperatures extend no further. Above 300,000 ft the temperatures shown have been computed using assumed values of molecular weight based on the best available theory and experiments, together with values of the ratio of temperature to molecular weight as determined from rocket instruments up to about 1,000,000 ft, and from theory or other knowledge above this altitude.

In constructing the curves, standard variations of the ratio of temperature to molecular weight with geopotential altitude were assumed, consisting of a series of straight lines for various altitude regions. After applying the molecular weight functions described in the section below on "Molecular Weight" the result is a temperature curve which is also a series of straight lines up to about 300,000 ft but exhibits a definite curvature in the region just above 300,000 ft and again in the region above 600,000 ft. These curvatures are due to the abrupt changes in slope of the molecular weight curve described below.

Molecular Weight

Atmospheric composition at high altitudes is thought to vary considerably from that near sea level. The variation in composition may result from dissociation of various molecules of the atmosphere as well as from diffusive separation of molecules of various masses in a gravitational field. While several theories describing these phenomena exist, there are only a few data to support or disprove these theories.

At altitudes up to about 300,000 ft the molecular weight appears to remain approximately constant, and has been so assumed for the present chart. Between about 300,000 ft and 500,000 ft it is thought that the dissociation of O_2 is the principal factor in producing a change in molecular weight. Rocket measurements of O_2 concentration provide partial support to this contention. Diffusive separation and the dissociation of N_2 are thought to dominate the variation of molecular weight of the mixture of atmosphere gases above 600,000 ft.

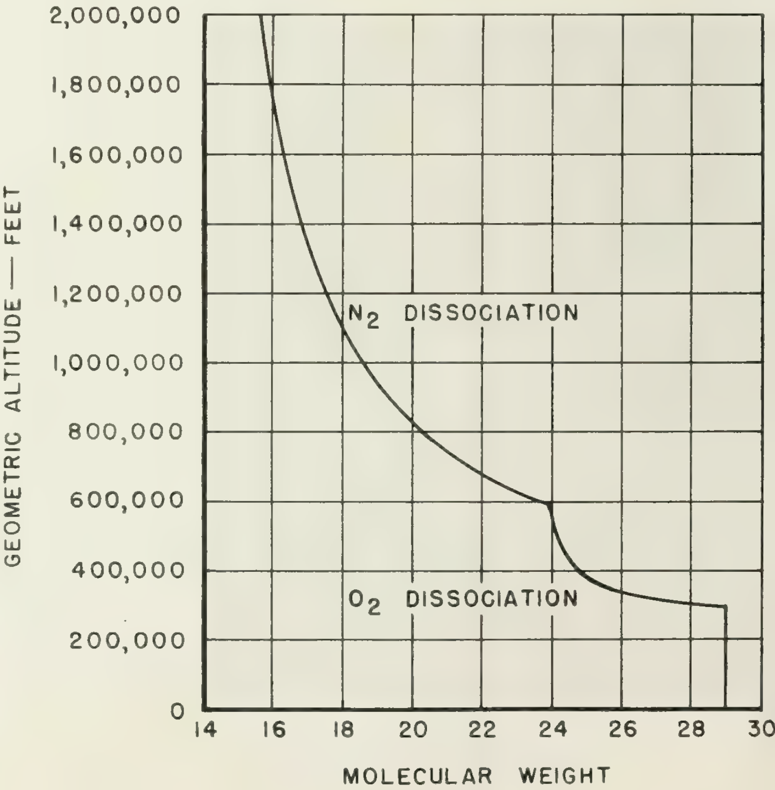
The Geophysics Research Directorate developed analytical functions in the form of two equilateral hyperbolas that are a reasonable approximation of the theories, assumptions, and data defining molecular weight. The figure shows a plot of the resulting molecular weight.

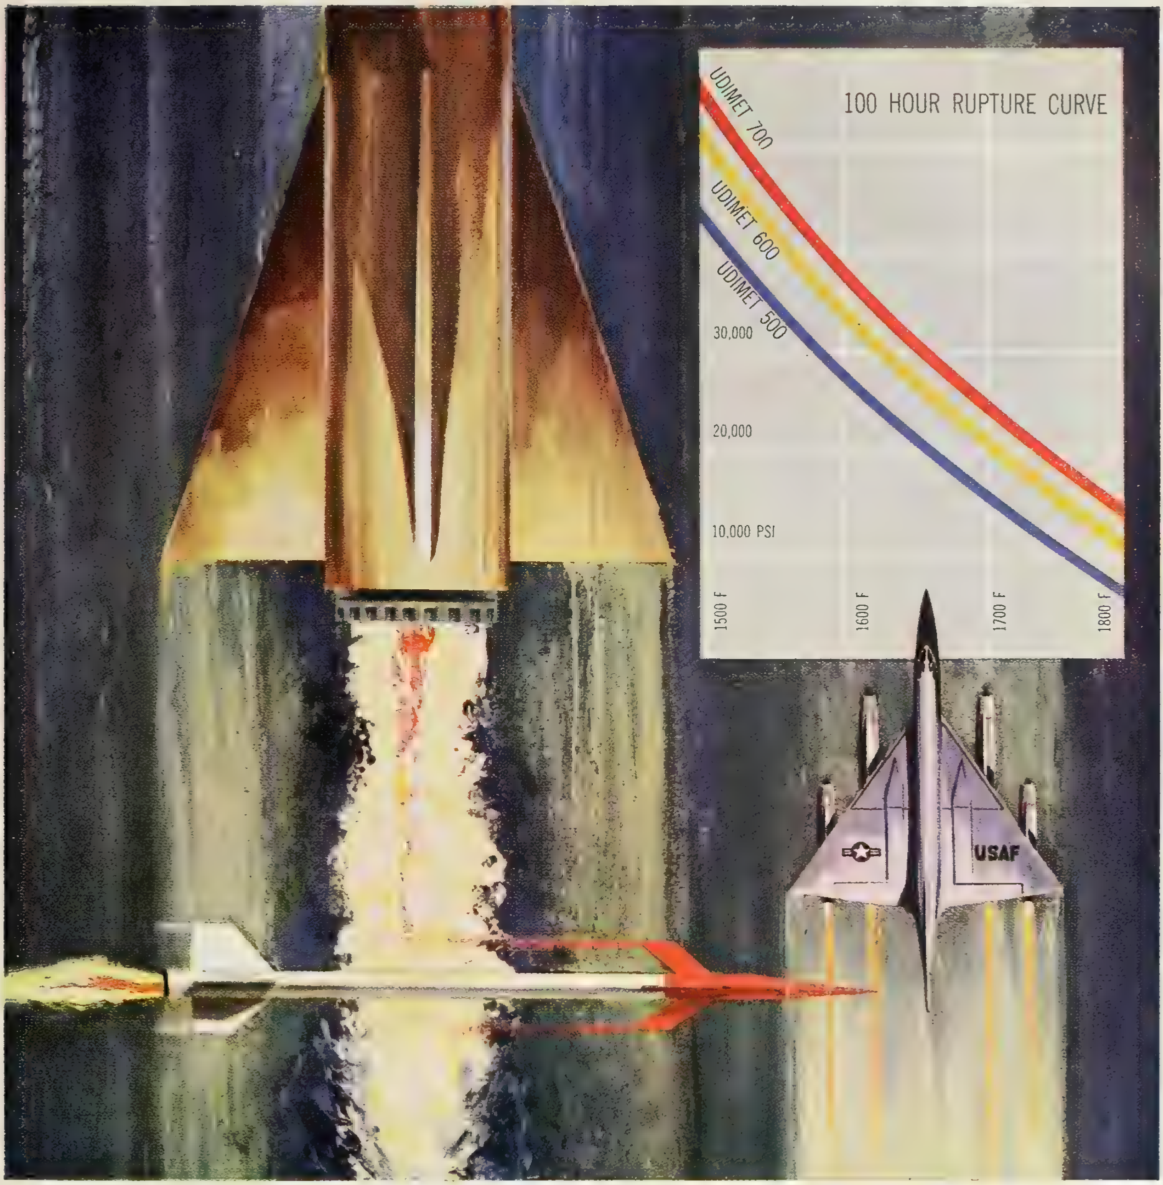
Geopotential Altitude

The concept of geopotential derives from the fact that the amount of energy required to lift an object decreases with altitude because the acceleration of gravity decreases with altitude. The geopotential of a point is defined as the increase in potential energy per unit mass lifted from mean sea level to that point against the force of gravity.

Geopotential altitude, which reflects the relative amount of energy required to lift an object to a given altitude, is a parameter involving both gravity and altitude and thus reduces by one the number of variables in equations relating the various atmospheric properties. This reduction in the number of variables comes without requiring the erroneous assumption of constant acceleration of gravity.

A unit of geopotential altitude is thus actually a measure of energy. It is very useful for certain atmospheric studies, but the geometric altitude was selected as the basic altitude function for these charts because of its clear physical meaning.





MANY VACUUM INDUCTION MELTED METALS AND ALLOYS CAN NOW BE PRODUCED IN HEAT SIZES UP TO 5,000 LBS. BY UTICA METALS DIVISION

announcing Udimet 600 and 700

for a wider range of applications at elevated temperatures!

With the development of these two new alloys, the Utica Metals Division of Kelsey-Hayes scores another materials "break through" with vacuum induction melting. Producible only by the vacuum induction melting process, *Udimet 600 and 700 surpass the elevated temperature properties of any other known alloy which can be produced in quantity for critical high-temperature, high-stress requirements.* They not only possess excellent stress-rupture qualities but also exhibit high tensile strength at temperatures above 1500°F.

Like Udimet 500, Udimet 600 is now available in production quantities. Udimet 700 is available for development applications. Write for complete information.

vacuum induction melting develops

- High-temperature corrosion resistance
- Increased ductility
- Extreme cleanliness
- Precise chemical control
- Longer stress-rupture life
- Increased tensile strength
- Better fatigue resistance
- Greater yield strength
- Greater impact resistance
- Greater creep properties

IRE Switches From Recruiting To Sales

By Raymond M. Nolan and Peer Fossen

New York—The big show came to New York again this year, and with it came a change of emphasis—from recruiting to selling.

The recruiting effort of 1957—which caused many companies to shy away from this year's Institute of Radio Engineering convention, was largely absent.

Except for a few companies with heavy major missile programs, recruiting was confined to a search for experienced specialists. Company officials agreed that such talent is hard to come by, but that inducements besides salary—such as profit-sharing incentive plans—might be of some help.

One trouble is that most desirable men are already comfortably slotted in top spots with their present employers, and are loathe to leave, even for attractive incentive offers.

• **Missile shift reason?**—Many reasons have been advanced for the decline in recruiting activity, and, while some blame it on the current recession, most recruiters agreed that the shift in emphasis from aircraft to missiles has been the deciding factor.

With airframe activity lessening day by day, the era of the platoon system of engineering seems to be drawing to a close. In the small-to-medium-sized companies now prominent in the missile field, the emphasis is on individual quality rather than on mass "scatter" attack. This one factor, more than any other, means that enough basic engineering talent is on the market to fill industry needs.

However, this situation excludes companies with programs of such a nature that they cannot meet contractual requirements without substantial addition to staff.

• **More exhibits**—With the marked shift in emphasis to selling, the convention this year and more and better exhibits than ever before—over 950 exhibitors and something like 2½ miles of exhibits. Enough interest was generated to result in a waiting line at the New York Colosseum doors at opening time on the first day of the convention. Exhibits ranged from a full-sized 28-foot diameter parabolic antenna to a pinball machine which impacted a klystron tube with High-G shock when players hit the right bumper.

Most significant fact about the various exhibits was the selling effort connected with them. Attendees were able to ask questions about either technical or money matters and get answers from teams manning the booths. As one exhibitor put it: "We're selling hardware, not buying bodies."

Gossip at the sessions ranged from the question of who would be the prime contractor on the Navy's projected *Subroc* program, to who had the fanciest digital read-out device. In this latter category, viewers were confronted with some of the most spectacular electronic equipment in existence today. Automatic read-outs displayed ranged from electronic adding devices, complete with plus signs, to fast-cycling counters with hundreds of individual read-out tubes.

• **Trend to missiles**—Very significant was the trend away from aircraft orientation and toward missiles.

This was strongly indicated by the most important meeting of the convention—the Tuesday night session on the Waldorf-Astoria's Starlight Roof. Its theme: Electronics in space.

Participants were E. Stuhlinger, of the Army Ballistic Missile Agency; C. S. Draper, of Massachusetts Institute of Technology; Maj. D. G. Simons, of the Air Force; J. B. Wiesner of MIT, and F. L. Whipple, of the Smithsonian Astrophysical Observatory.

Their discussion concerned the evolution from existing concepts to the role of electronics in space—not only that, but electronics for defense and for war.

The round-table which included these scientists discussed informally the use of electronics for propulsion, navigation, communications, telemetry and instrumentation. The basic question raised was: what new areas must be anticipated for existence inspace at blast-off, en route and in the terminal environment.

Much discussion throughout the convention concerned the subject of reliability. Panelists and audience could go back three or four years to a time when this concept did not exist, but all concerned realized that reliability is the hinge on which all developmental work swings.

Alfred R. Gray, of The Martin Co., Orlando, pointed out that the "statistical cliche" cast no reflection on the general subject of reliability. However, he emphasized that he has no quarrel with those reliability engineers who have constantly stated that the theoretical relationship between component-part reliability, complexity and weapon-system reliability are so important in the overall weapon system field.

He indicated that there has been a pendulum swing, during the last three years, from a relatively uncontrolled reliability to a type of reliability effort using "too many chiefs and too few Indians."

One of the more interesting papers presented concerned radar antennas capable of detecting enemy missiles up to 3000 miles.

Devices to sense signals in the 3000 miles range would normally be large and unwieldy, and therefore difficult to sweep back and forth. However, the antenna described by engineers of Westinghouse Electric Corp. solve this problem by cycling the beam electrically while the antenna remain fixed.

This is particularly important on stations such as the northern DEW line and the Texas Tower picket line where high winds are normal weather conditions.

The general consensus of delegates was that the IRE has finally swung away from a promotional operation designed to recruit large numbers of engineers into a real trade convention—one which has the primary purpose of selling the products manufactured by the exhibitors.

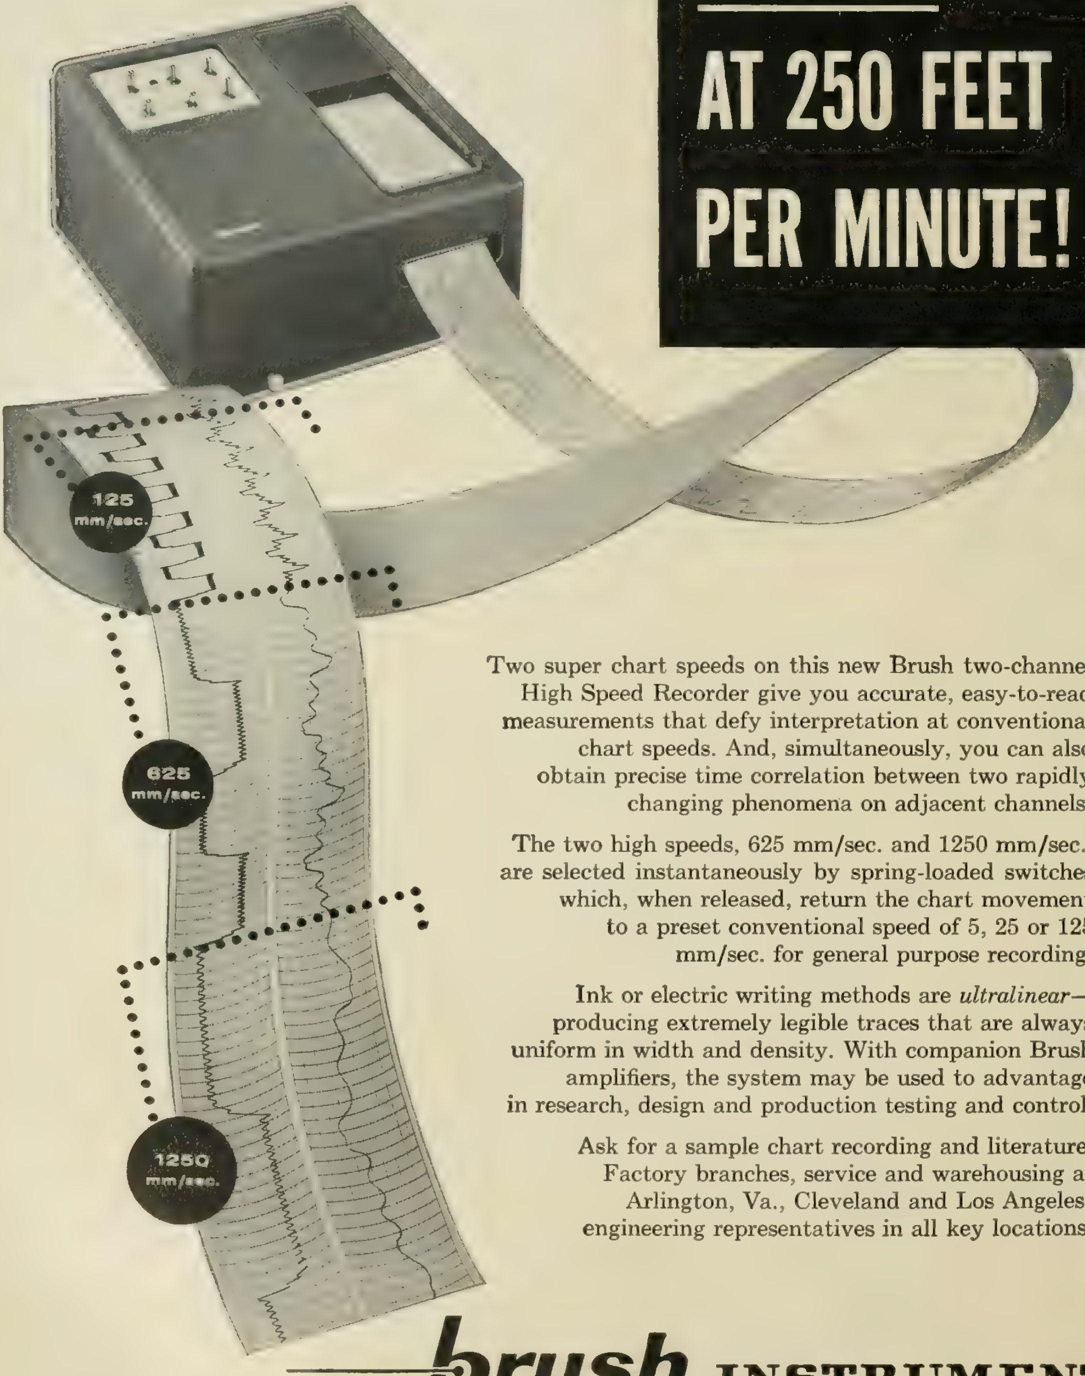
When readouts look impossible . . .

STRETCH THEM AT 250 FEET PER MINUTE!



Two super chart speeds on this new Brush two-channel High Speed Recorder give you accurate, easy-to-read measurements that defy interpretation at conventional chart speeds. And, simultaneously, you can also obtain precise time correlation between two rapidly changing phenomena on adjacent channels.

The two high speeds, 625 mm/sec. and 1250 mm/sec., are selected instantaneously by spring-loaded switches which, when released, return the chart movement to a preset conventional speed of 5, 25 or 125 mm/sec. for general purpose recording.

Ink or electric writing methods are *ultralinear*—producing extremely legible traces that are always uniform in width and density. With companion Brush amplifiers, the system may be used to advantage in research, design and production testing and control.

Ask for a sample chart recording and literature. Factory branches, service and warehousing at Arlington, Va., Cleveland and Los Angeles; engineering representatives in all key locations.

Antenna Design Aims At Sensitivity

The ever-growing application of electromagnetic waves for communication, navigation and detection has served to intensify antenna research activities. Main research objectives: greater efficiency and reliability, lower initial cost, reduced maintenance expenditures and simplicity.

The search for newer and better antennas has resulted in strangely shaped structures and monstrous configurations that are a far cry from the early straight-wire aerial.

Stanford Research Institute is currently experimenting with an entirely new antenna concept designed to meet the need for more sensitive point-to-point radio and TV communication in the vhf-uhf (30 to 3000 mc/s) range. A short segment of this antenna is similar to the common parallel rod Yagi TV antenna, but the overall design differs in that the cross rods are displaced in a spiral around the axis which is considerably longer than that of the Yagi.

Extending the length is desirable, since the signal-amplifying ability of an antenna normally increases in proportion to increases in its length. In the case of the conventional Yagi, however, there is a practical limit beyond which added length yields very little increase in signal intensity. The new spiral arrangement of the rods is expected to overcome this limitation and enable the full advantage of a long axis.

The experimental model in the accompanying photo has a physical length of 10 feet and the plane of the cross rods makes a complete (360°) twist over the length of the axis. Antennas of many times this length are expected to be used advantageously in installations which would normally require expensive paraboloids. Indications are that the gain of a twist antenna 50 wavelengths long would be about 25 to 26 decibels.

A second SRI project involves a parabolic segment antenna designed for research use in Alaska in conjunction with a large dish-type antenna to study the aurora. The large "dish" transmits 400-mc/s signals which are reflected by the aurora and picked up by the parabolic segment antenna located approximately 50 miles away. Data obtained from the received aurora-modified signals are being used to study the characteristics of the aurora.

SRI is also conducting a series of tests at the Radio Propagation Field site to study moon and meteor "echoes." A broadside Yagi array is being utilized in conjunction with a large dish antenna. 100-mc/s signals are beamed from the large dish to the moon where they are reflected to the broadside Yagi. The returning signals provide data about the moon's surface as well as about the upper atmosphere. Other studies are being made of the way signals are reflected from meteors.

Electronics Spending Continues Rise

Department of Defense spending for missile electronics over the first half of FY 1958 totaled $572 million according to Electronics Industries Association's second quarter report. The report indicates the amount for the second quarter to be $299 million, or $26 million more than reported for the first quarter. The combined military spending for electronics over the first half of FY 1958 amounted to $1,893.5 billion, while the total for calendar 1957 reached an all-time high of $3.9 billion.

Intended primarily to depict trends, and subject to later revision, the EIA computation shows the following missile electronics figures (in $ million) for the first and second quarters for fiscal years 1957 and 1958:

1st Quarter FY 1958	*2nd Quarter FY 1958*	*1st Quarter FY 1957*	*2nd Quarter FY 1957*
$273	$299.0	$205	$259

Total electronics spending for same period was:

Budget Category:				
Aircraft:	340	346.0	213	270
Ships & Harbor craft	23	25.0	17	19
Combat vehicles.	1	–.2	2	2
Support vehicles	1	.7	..	1
Missiles	273	299.0	205	259
Elec. & Comm.	204	214.0	130	236
Research & Dev.	73	74.0	65	76
Miscellaneous ..	11	9.0	5	13
	926	967.5	637	876

For further comparison, see m/r February 1958, page 75.

Missile Warning System Under Study Two Years

Arthur L. Malcarney, executive vice president of RCA Defense Electronic Products, recently revealed that award of a missile-warning system contract by the Air Force to RCA had been preceded by a company-financed program of research into the area.

"A warning system against possible ballistic-missile attack is not a new problem to us," Mr. Malcarney said. "Utilizing our own resources, we have been studying the situation for more than two years."

The new warning system will be installed at top-secret locations where long-range radar will be utilized to seek out and pinpoint any ballistic missile firings with hostile intent. The connecting radar outposts will feed the information to a centrally located brain center in the United States.

Computers "Fire" Rockets in Tests

Machines cut actual launching need to minimum

by Peer Fossen

WHEN THE WHITE SANDS Proving Ground in New Mexico was established shortly after World War II to study captured V-2 rockets, America's military men believed the only sure way to test a missile was to fire it and then watch it closely.

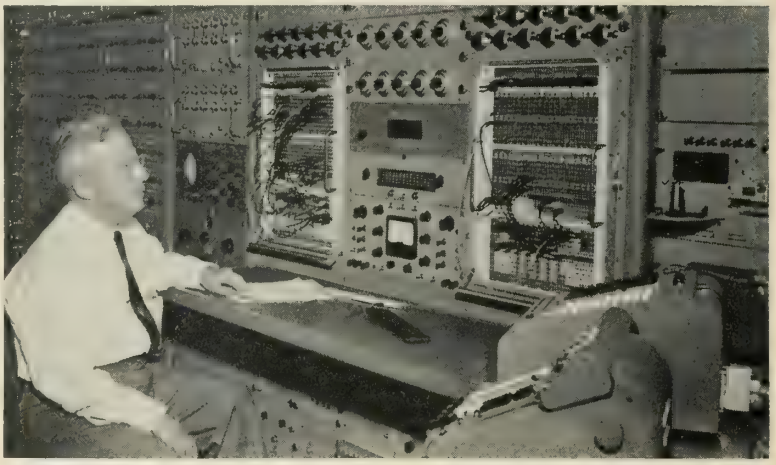
As experience was gained in this new field, the concept changed drastically, and today, the military is obtaining as much valuable scientific information by "mock" firings in the two-year-old Flight Simulation Laboratory as from actual range launchings. Scientists working in the laboratory are saving the country's taxpayers millions of dollars each month.

Although flight simulation is still in its infancy, its fantastic growth in this short span has prompted the need for better working quarters. A large new building with increased facilities is planned for next year, to meet this need.

Simulated missile performance is nothing new in scientific circles. V-2 scientist Guenther Hintze carried out "mock" launchings on a somewhat smaller scale in Germany toward the end of World War II. The efforts were rather limited due to inadequate equipment and the newness of computer technology. Actual missile components were at that time tested on tilting tables in the laboratory at the Peenemunde base.

Hintze, who came to WSPG with other German missile experts in 1946, today spearheads the work here as chief of the Flight Simulation Laboratory. Since setting up simultation at WSPG he has perfected the system to the point where no component of the missile is required for the "mock" testing in the laboratory, a desired improvement.

The flights are simulated mathematically by giant computers, reducing actual missile launchings appreciably. The data collected through the laboratory tests rarely varies more than two to five percent from those obtained through actual launchings, a very low variation.



GERMAN-BORN scientist Guenther Hintze prepares an analog computer to "fire" a missile at WSPG's Flight Simulation Laboratory.

Everything about the missile, and the many variables that might influence its flight behavior, are expressed in mathematical equations. These equations reflect such variables as the missile's weight, size, velocity and thrust, as well as data on atmospheric conditions that might affect the simulated missile flight.

The equations are fed into computing machines to set up the firing problem. Setting up a master problem might cost from $5000 to $10,000, but this is a small sum considering the multitude of test flights that will arise out of one problem. A slight change in one variable will create a completely new flight.

In comparison, a live test firing of even the most inexpensive American missile will cost $100,000 or more.

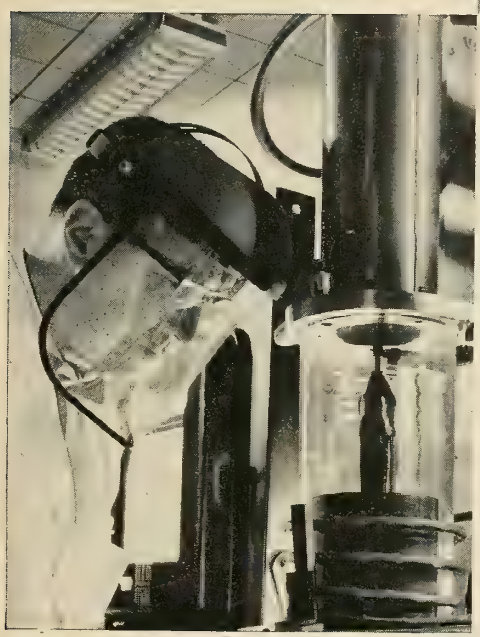
Two types of computing machines are used for the tests, digital and analog. The digital machine ejects its information in the form of numbers while the analog computer expresses its answers in voltages which are later plotted on graphs.

The "mock" firings at the laboratory far outnumber the live launchings on this integrated range shared by the Army, Navy, Air Force, and Marines. The value of the simulation program, says Guenther Hintze, can be summed up in these three major points:

1) Range safety—Simulated firings indicate whether a planned range firing would overleap the safety boundries, proving a trajectory in advance of actual launching.
2) Savings—The laboratory firings are inexpensive as compared to live launchings.
3) Flexibility of flight patterns—Flights can be planned in the laboratory down to the smallest detail. It is always possible to back up and start over again with a minimum of time, effort and cost.

In spite of the essential role simulation plays in missile development and testing, there is a limit to the kind of information and data it can yield. The final answers to missile-performance speculations and problems must come from the real firing. But simulated firings such as these will make the task easier.★

DELCO HIGH POWER TRANSISTORS are made from



In the center of the quartz housing, a germanium crystal is being grown. A "perfect crystal lattice," it will be cut into wafers 3/10ths of an inch square and less than 1/100th of an inch thick to become the heart of Delco High Power transistors.

GERMANIUM

because it alone combines these 5 advantages:

Lower saturation resistance—Germanium gives Delco High Power transistors a typical saturation resistance of only *3/100ths* of an ohm. No other present material offers this characteristic, which permits efficient high-power switching and amplification from a 12- or 24-volt power supply.

Higher current gain—Gain with germanium is not only higher but is more linear with current.

Lower distortion—In many applications, distortion requirements can be satisfied only with germanium transistors.

Lower thermal gradient—As far as deliverable power of present devices is concerned, germanium meets the need and, in addition, provides a thermal gradient of only 1.2° C/watt.

Greater economy—More power per dollar.

Examine Delco High Power germanium transistors and see how practical it is to go ahead with your plans now. For high current applications there is no better material than germanium, or Delco Radio would be using it. All Delco High Power transistors are produced in volume; all are normalized to retain their fine performance and uniformity regardless of age. Write for engineering data and/or application assistance.

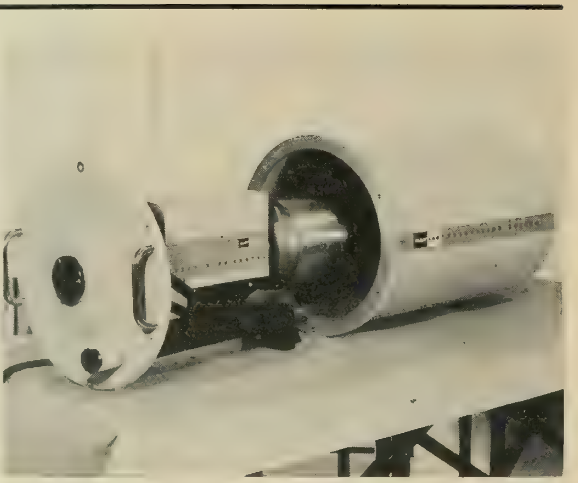
SIZE COMPARISON. Package on right is one of several proposed for uses other than satellite.



NUMBER OF MERCURY cells needed for 500 milliwatt transmitter (on left) and number of similar cells needed for new transmitter.

Reduced-Size Satellite Transmitters Coming

by Raymond M. Nolan

Now that the United States has succeeded in launching satellites of both the *Explorer* and *Vanguard* types, attention has shifted from the launching to the satellite payload. This has thrust the satellite transmitter and its associated power pack into the spotlight as a really critical element.

Research along the lines of ultra-miniaturized transmitters and smaller power packs by the Naval Research Laboratory and the DuKane Corp. of St. Charles, Ill. has resulted in a design which should play an important part in future orbiting payloads and also in moon-orbiting or impact payloads.

The new transmitter, which should allow broadcasting from two to four times as long as present satellite units, is a 500 milliwatt version of NRL's 100 milliwatt satellite transmitter. It is crystal controlled and employs three recently developed Western Electric transistors capable of operating as oscillators or amplifiers at 108 mc/s, the IGY satellite frequency.

The special circuits developed for the transmitter give much greater overall efficiency than is now possible with vacuum tubes. In fact, a tube transmitter developed for the same purpose requires five times the battery voltage and five times the battery power needed by the new transistorized unit. In reference to satellite use, this means a highly significant saving in weight, since fewer batteries can do the same amount of work. Or, using the same batteries, the satellite transmitter can broadcast for a longer period of time.

This particular transmitter, described by Michael Supitilov, DuKane Research Director, as a "new combination of known components," is designed primarily for use in the satellite program. Its broadcast signals would be used in telemetering information on space conditions to monitor stations throughout the world, and as an aid in tracking the satellite's path.

The tiny unit weights less than three ounces, and occupies less than six cubic inches of space (a pack of cigarettes occupies about seven cubic inches). For a power output of 500 milliwatts, it uses one-half to one-fourth the battery power needed by any other transmitter now known.

Typically, the output stage of a conventional tube-type transmitter doing the same job would need 4620 milliwatts input power to produce 500 milliwatts output. By contrast, the output stage of the new transmitter needs only 930 milliwatts power to produce the same output. The corresponding efficiencies are 11 percent and 54 percent.

As an additional advantage, the unit operates on a single 20-to-24 volt battery, whereas a tube-type transmitter requires both low-voltage filament and high-voltage plate supplies.

Tubes also generate, and the heat must be dissipated, a problem which crops up often in miniaturization. The transistor circuit greatly reduces this problem. Simplified circuitry and re-

Comparison of DuKane's 108 Megacycle Satellite Transmitters

Stage Characteristics at 500 Milliwatt Output

Total Input Power to Final Stage	4620 milliwatts	930 milliwatts
Overall Final Efficiency	10.8%	53.8%

duced shielding problems because of low operating impedances also make it possible to squeeze an amazing amount of transmitting power into an extremely small space.

The transmitter can be operated on solar batteries, drawing its power from the sun and sending out its signals indefinitely, but with one-half to one-fourth of the solar surface heretofore required for exposure.

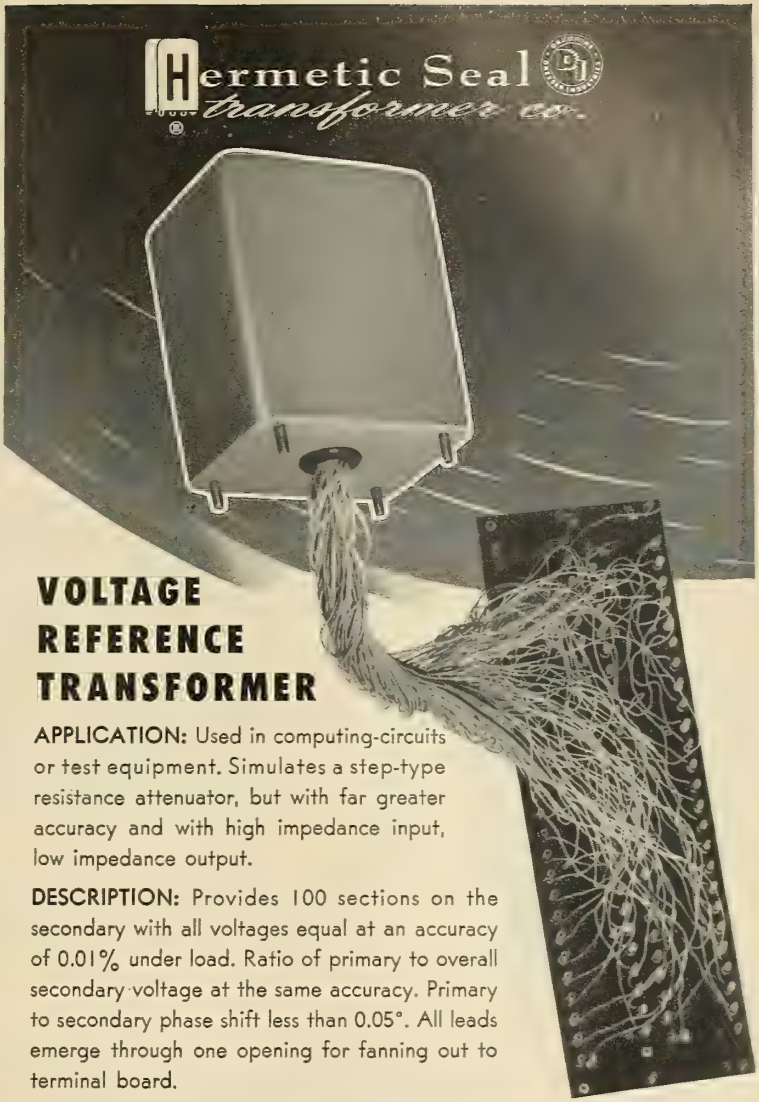
A comparison of the operating efficiencies of the new circuit and a typical tube-type circuit is given in the box.★

Westinghouse Develops New Missile Gyro

Westinghouse Electric Corp.'s Air Arm Division recently announced the development of a new subminiature rate integrating gyro for missile guidance and airborne armament control systems. The new design designated as SIR-1 (subminiature integrating rate) gyro Model No. 1, incorporates manufacturing techniques which make possible a cost reduction of as much as 50 percent over comparable gyros.

Main design objectives are: (1) simplified construction of both the moving coil and the magnet stator of the torque assembly; (2) ease of initial alignment and simplicity in fabrication of the signal generator; and (3) use of solid stator for the spin motor, eliminating manufacturing operations necessary with conventional laminated assemblies.

The following performance characteristics have been released by West-



Hermetic Seal transformer co.

VOLTAGE REFERENCE TRANSFORMER

APPLICATION: Used in computing-circuits or test equipment. Simulates a step-type resistance attenuator, but with far greater accuracy and with high impedance input, low impedance output.

DESCRIPTION: Provides 100 sections on the secondary with all voltages equal at an accuracy of 0.01% under load. Ratio of primary to overall secondary voltage at the same accuracy. Primary to secondary phase shift less than 0.05°. All leads emerge through one opening for fanning out to terminal board.

HERMETIC SEAL TRANSFORMER CO. can provide high accuracy voltage reference transformers or autoformers to specifications with accuracies even better than shown above. The production of this type of transformer requires the special design and the special testing techniques which are customary at Hermetic Seal Transformer Co. Your inquiries are invited. No obligation.

SEND TODAY for your FREE copy of 1958 Catalog No. 102 illustrating and describing 390 stock and many special-application transformers and other electronic components.

inghouse as result of its tests:

Range—plus or minus 120° per second;

Resolution—0.002 degree/second (the earth's rate is 0.0042 degree/seconds);

Linearity—within 0.1 per cent of maximum value;

Mass Unbalance of Gimbal—0.3 dyne-centimeter;

Dimensions—length, 3 inches; maximum diameter, 1½ inches at mounting ring;

Weight—7 ounces;

Angular Momentum—3000 dyne-centimeter seconds;

Viscous Damping—3000 dyne-centimeter/radian/second.

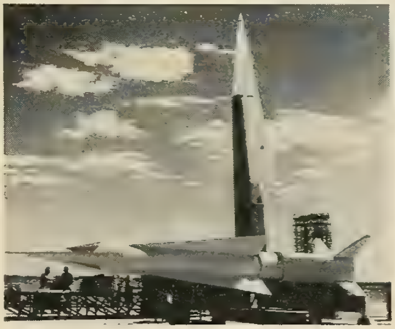
Other features of this development include: (1) a d'Arsonval torque generator for linearity of command and absence of residual torques; (2) a new signal generator for linear measurement of gimbal angle and the absence of residual torques; (3) jewel gimbal bearings for minimum friction; (4) a continuous temperature-controlled fluid damper for a constant damping factor; (5) a full-floated gimbal assembly to insure resistance to the effects of shock and vibration, and to insure low friction at the gimbal bearings; and (6) a high-torque spin motor capable of reaching synchronous speed of 12,000 rpm in four seconds.

Several development models and a preproduction prototype of the unit have been completed.

ICBM Detection Rig Transmits High Power

Cornell Aeronautical Laboratories and the Army have revealed what is considered an important advance in development of ICBM detection devices. An ICBM, because of its extreme speed and unusual configuration, is difficult to detect with present-day radar equipment. Therefore, any radar contemplated for anti-missile use must have a great deal more power than a corresponding radar used in aircraft detection.

CAL, working on the project under an Army Ordnance research contract applicable to Army missile systems, designed the high-peak-power microwave equipment. Using a special microwave generator, the laboratory has transmitted radar-like signals at a peak power of 21 million watts. This power output is many times more powerful than heretofore believed possible, and is believed to be the largest peak power ever radiated.



What do these latest aircraft and missiles have in common?

All are equipped with Genisco flight control
or instrumentation accelerometers.
What better proof of reliability?

With component reliability getting increased attention from missile and aircraft designers, it is significant to note the number of supersonic weapon systems equipped with Genisco accelerometers.

A complete list reads like a roll call of tactical and strategic missiles and aircraft now in the nation's arsenal. Included are such weapons as the *Atlas, Thor, Nike Ajax, Nike Hercules, Bomarc, LaCrosse, Bull Pup, Talos, Dart, Matador, Corporal* and *Terrior* missiles; and the F100D *Super Sabre,* F101 *Voodoo,* F106A, and Canada's CF105 aircraft. What better proof of the reliability of Genisco instruments than this acceptance by designers of these weapons?

Combining product reliability with guaranteed delivery schedules and competitive pricing has made Genisco the free world's largest producer of potentiometer-type flight and fire control accelerometers. More than 40,000 have been delivered to date.

Send for technical data sheets on all Genisco Accelerometers.

NEW TYPES ADDED TO BENDIX NOISE SOURCE TUBE LINE!

Expanding its line from 9 types to 35 types, Bendix Red Bank now offers a great variety of noise source tubes.

But great variety is only one advantage. Noise source tubes that are free from ambient temperature corrections are the result of making tubes so that no correction in noise figures is necessary from −55°C. to +85°C. What's more, long life and unusual stability result from precise quality control—far beyond the usually accepted tolerances for such products.

Whatever your applications, whether for 10° or 90° angle mounting, check with our specialists for the most efficient solution. Write RED BANK DIVISION, BENDIX AVIATION CORPORATION, EATONTOWN, NEW JERSEY.

Navy to Test *Polaris* In about 18 Months

Polaris, underwater missiles and detection of submarine-launched missiles were major items discussed at a recent press conference held by RAdm. F. S. Withington, Chief of the Navy Bureau of Ordnance.

Adm. Withington told newsmen the Navy would carry out the first actual tests of *Polaris* in about 18 months. The tests, he said will be conducted off the Cape Canaveral test center, first from a fixed platform and then from a mobile launcher. Following further test launchings from the USS *Observation Island,* the underwater missile will be taken aboard a submarine as a full-fledged operating weapon.

Turning to another phase of submarine-launched missiles, Adm. Withington said detection of such missiles is still an important unsolved problem. A third item in the same area was the admiral's statement that the Navy is interested in an underwater-to-air-to-underwater missile. In the area of submarine detection and defense, he stated sonar capability today is five times as good as that in use during World War II.

Other points which came up during the conference included a proposal to use a beefed up version of the *Talos* as anti-missile missile is under consideration by the Army. The admiral explained the proposal calls for boosting the ramjet propulsion of *Talos* to a speed of Mach 10 within the next 10 years, and added the comment that the missile would be capable of flights to an altitude at more than 50,000 feet.

Touching on other matters, Adm. Withington said the addition of metallics to composite fuels is a major breakthrough in solid fuels. While the addition of metallics greatly increases the energy, a big problem is methods of handling the heat generated when aluminum powder is added to the fuel supply, he said.

Adm. Withington said nuclear warheads are not planned for use in mines and the rocket-assisted torpedo, known as *RAT,* because of *RAT's* short range and the fact that it would be too dangerous to use fissionable material in actions originating on the ocean bottom.

It will be several years before all ships of the Fleet can be equipped with missiles because of the expense, the Ordnance Bureau Chief told members of the press.

Bench-Top Proving Ground for Missile Controls!

Directional controls for guided missiles . . . tracking and scanning devices . . . cameras . . . range finders—how well they work depends greatly on the efficiency of their optical systems.

Recognition Contrast Rendition equipment at B&L completely eliminates human error in measuring optical efficiency. Its direct-reading scale automatically rates how well an optical system can "see" under lighting conditions of variable intensity, as experienced in actual use. Accuracy: 1/40th of a wavelength of light!

This instrument is not for sale. It is part of the unique quality control system that has made Bausch & Lomb the dependable optical source.

Guidance System Development

Also working under the direction of the Special Projects Office, U. S. Navy, on various phases of the POLARIS weapon system are: U.S. NAVY BUREAU OF SHIPS, SPERRY GYROSCOPE CO., WESTINGHOUSE, and over 200 sub-contractors—a team of America's topmost scientific talent with vast technological resources, working on the Navy's top-priority missile project.

Fourteen months ago Lockheed was appointed missile system manager of the POLARIS. The objective: to develop a solid-propellant missile with a thermonuclear warhead, which could be launched underwater from nuclear submarines to hit targets 1,500 miles away. The technological problems involved were admittedly the most complex yet encountered in the history of ballistic missile development.

Progress to date on the POLARIS has exceeded all expectations of the U.S. Navy. Lockheed is proud to be associated with its fellow task force members and the sub-contractors developing the complete POLARIS weapon system. The brilliant contributions and splendid teamwork of these more than 200 POLARIS subcontractors, and their dedication to our mutual goal—greater security for our nation—speeds the progress of the POLARIS missile system, prime responsibility for which is Lockheed's.

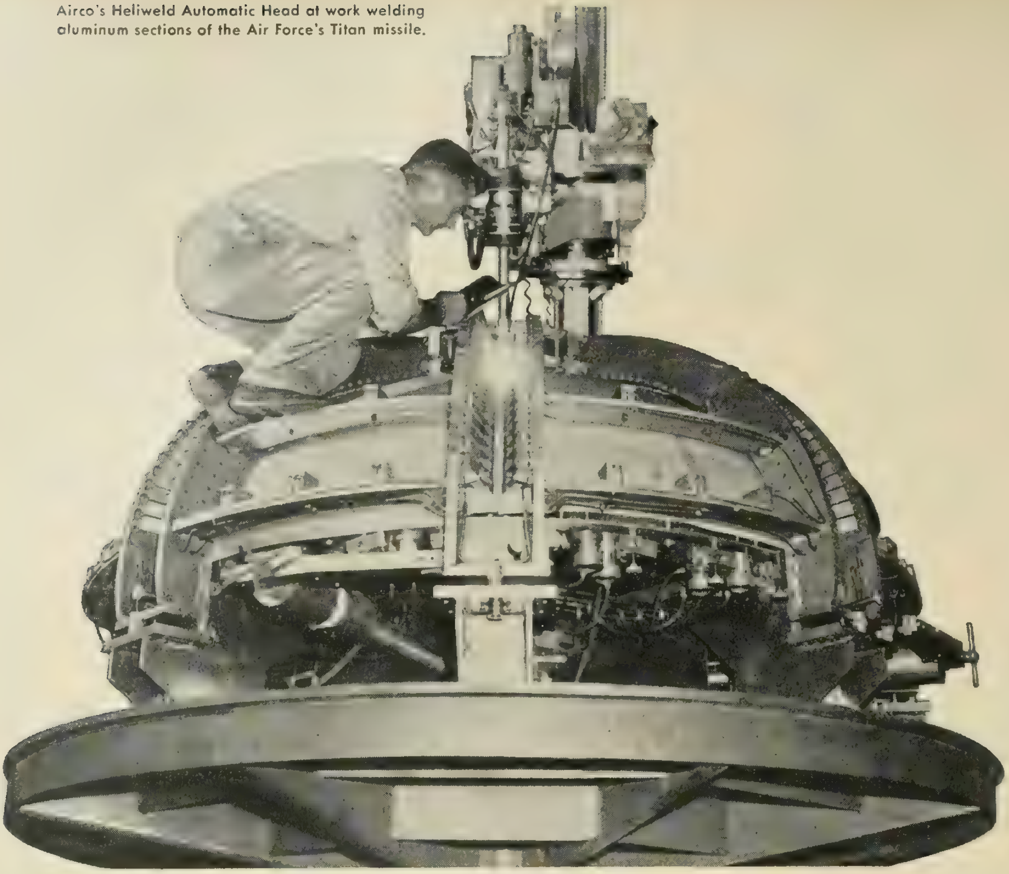
Airco's Heliweld Automatic Head at work welding aluminum sections of the Air Force's Titan missile.



AIRCO HELIWELD PROCESS WELDS MISSILE FUEL TANKS

To weld the thin aluminum fuel tank "orange peel" sections of the Air Force's Titan, the Martin Company uses the largest precision welding tool installation in the United States. It is designed and engineered by Air Reduction's Machine Welding Dept. Key unit in the equipment is the Airco Heliweld Automatic Head, which, with its precision arc voltage control, gives consistent high quality weld results. The unit is flexible, can be used for ferrous or non-ferrous materials.

Heliweld equipment for other industries

Versatile Heliweld units are available for use wherever smooth, high quality welds are required, involving either regular or irregular shapes. Typical applications: tubing, piping, steel strip, electronic components, aircraft, food processing machinery.

For complete information call your nearest Air Reduction office.

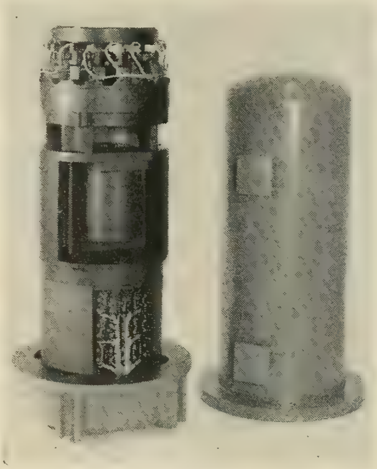
Multiplexer handles signals from 90 units



A device for PDM commutating and coding has been developed by Consolidated Electrodynamics. Termed the type 40-101 Plexicoder, the instrument commutates signals from up to 90 transducers at 112.5 samples per second and converts them into duration-modulated pulses suitable for telemetering or magnetic tape recording. The unit is designed for flight-test instrumentation in missiles, rockets, or manned aircraft.

In the instrument, low-speed magnetic switching at the input, with high-speed commutation and coding accomplished by interrupting a light beam, replaces rotating wiper-arm assemblies and wide-band chopper-stabilized amplifiers. Transients in the data-channel input circuit are practically eliminated by galvanometers with their inherent natural filtering characteristics.

Designed for a service-free life of 1000 hours, the Plexicoder is compatible with low-output resistive-type transducers, its output can modulate a transmitter or subcarrier oscillator, and it can be used with standard magnetic-tape recording equipment. It will accept single- or double-ended, high- or low-level inputs.

In the device, each input signal is fed through two hermetically sealed, magnetically operated switches, which act as a double-pole, single-throw switch, to a galvanometer. The unique design of this input switch eliminates induced voltages normally associated with a magnetic switch. These switches are opened and closed in a predetermined time sequence by moving magnets, so that a given galvanometer is energized by a transducer for only a specific time period. Each galvanometer may accept as many as six different inputs in sequential fashion.

The Plexicoder can provide four different operating modes or conditions from the same instrument, merely by changing adapter plugs in the input circuit. These modes are 90x1.25, 45x2.5, 30x3.75, and 15x7.5. In each mode, the commutation rate equals 112.5 samples per second.

The unit is shock mounted and will operate in any position. The instrument weighs 45 lbs. and is approximately 25″ high, with a diameter of 8¼″ except for the end section, which is 10½″. The unit is pressurized at 3 to 5 psi.

Clothes for Fuel Handlers Resists Acids, Corrosion

Newly developed industrial apparel of 100% DuPont Dacron has been introduced by Worklon, Inc. In addition to being resistant to damage by acids and corrosive chemicals, the new clothing has been proved unusually resistant to concentrated hydrogen peroxide.

Worklon blue or grey Dacron shirts, pants, laboratory coats and coveralls retain their tensile strength even after eight hours of immersion in 90% concentration of hydrogen peroxide at room temperature. The apparel will not ignite, even on longtime contact with H_2O_2.

Ceramoplastic Heat Limits Set Higher After Test

Operating temperature limits on Mycalex Corp.'s Supramica 560 ceramoplastic have been raised, due to an accidental overexposure of the material to 1600°F. The company had originally established the upper limits of the material at 950°F, but a control failure in the test oven boosted the temperature on a sample to 1600°F for more than 24 hours. The only damage done to the specimen was that two steel inserts were burned away, while the ceramoplastic sample suffered only scorched edges in the process but maintained its strength, retained its shape and was still firmly bonded to the remains of the steel bolts.

Teflon Tape Bonded to Copper Foil

Continental-Diamond Fibre Corp. is developing a glass-supported Teflon tape with copper foil bonded to one or both sides for use as etched flexible cable harnesses for missiles. The tape may also be used as flexible connector in multiple-array printed-circuit "stacks" for computers and control devices.

In this new printed-circuit material, electrolytic copper foil in weights of either 1 or 2 oz. per sq. ft. is applied to one or both sides of cementable glass-supported Teflon tape. Depending on the weight of copper foil and the Teflon tape grade, the overall thicknesses run from .006″ to .016″.

At the present time, CFD can furnish this material on a developmental basis in lengths up to 30′ and widths up to 6″. The company expects, within 60 or 90 days, to manufacture it on a production basis in lengths of 100 ft. or longer.

The new flexible materials have excellent shock and vibration resistance, combined with high mechanical strength and dimensional stability, plus excellent electrical properties. It can be bent to a radius of ½″. If supplied with copper foil on one side only, the other side can be furnished "cementable" or "non-cementable," as desired. For certain specialized applications, copper foil cemented to unsupported Teflon tape can be supplied.

High Temperature Relay Resists Shock, Vibration

A sensitive, miniature-tube relay with high shock and vibration resistance and 125°C ambient temperature capabilities is available from Potter & Brumfield, Inc. A 30% increase in shock and vibration resistance and a 50% decrease in power consumption was effected by redesigning and repositioning the armature and contact systems, balancing the armature, and improving the ampere-turns to reluctance ratio.

This SPDT relay operates on 40 milliwatts under shocks of 30g and vibrations of 10g to 500 cps. Where high shock- and vibration-resistance are not required, the unit, designated PW, will operate on 25 milliwatts. The relay will operate on current up to six amps and voltages up to 115 VDC.

The PW can be supplied with 7-pin miniature plug-in headers for tube socket or printed circuit mounting or with pierced solder lugs and brackets for flange mounting above or below the chassis. A balanced armature permits mounting in any position without significantly affecting shock and vibration resistance.

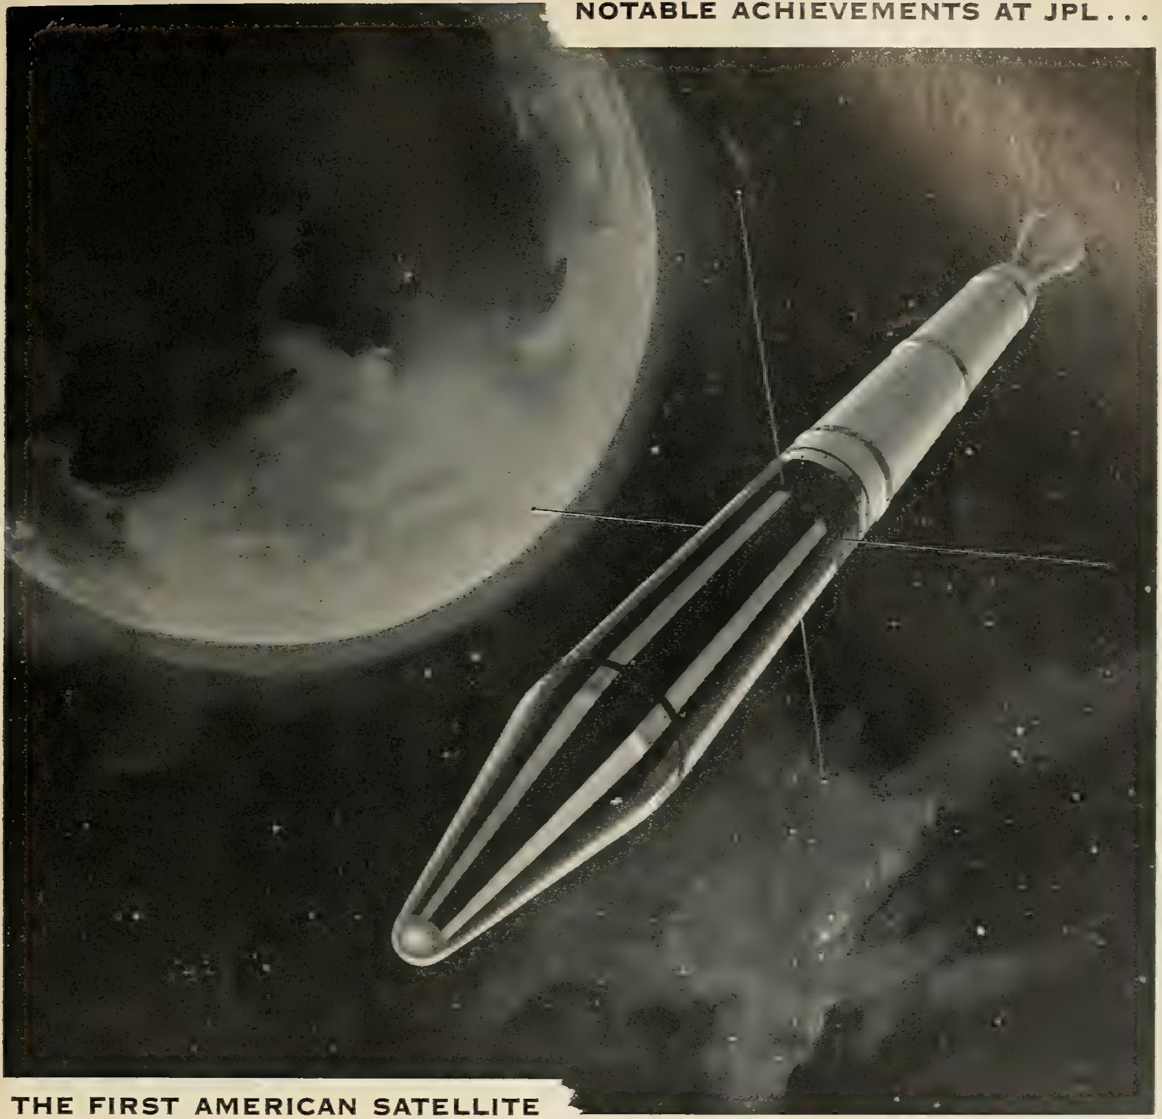
NOTABLE ACHIEVEMENTS AT JPL . . .



THE FIRST AMERICAN SATELLITE

With the launching of the "Explorer," in joint co-operation with the Army Ballistic Missile Agency, the Caltech Jet Propulsion Laboratory fulfills one of its prime functions as a pioneer of the future.

The Army's request for JPL to join in the effort to put an American satellite in orbit was the type of appeal most likely to arouse the enthusiasm of the Laboratory personnel — nearly 2,000 of them.

Challenged by this exceptional opportunity, JPL personnel designed and fabricated the final three stages of the Jupiter "C" missile and, in addition, designed and developed the satellite itself in 80 days.

The close co-operation and co-ordination of effort with the ABMA and the U. S. National Committee for the IGY, make JPL proud to have been a close partner with the U. S. Army in developing and launching the first American satellite.

Now, JPL, maintaining its established policy of scientific research, continues to assist in tracking, receiving, correlating and evaluating data from the "Explorer" as one of its many contributions toward solving the problems of the future.

bration, resistance to moisture and extreme humidity, resistance to radiation and complete resistance to formation of radioactive byproducts. The switch has a two-piece snap-action spring that provides sure contact.

Flat bosses around the mounting holes, on both sides of the switch case, facilitate rigid mounting on common screws or rods for multiple cam control of several electrical circuits. The contact arrangement of the high-temperature switch is single-pole double-throw. The switch may be wired either normally-open or normally-closed. It has standard screw-type terminals.

Characteristics of the V3-1301 include operating force, 6 to 14 oz.; release force, 4 oz. min.; pretravel, .047" max.; differential travel, .006" to .016"; over-travel, .031" min.; weight, .017 lb. max.

Electrical rating of the switch is 10 amperes at 125 or 250 vac; ½ ampere at 125 vdc, ¼ ampere at 250 vdc. At 30 vdc the inductive rating is 10 amperes at sea level and 6 amperes at 50,000 ft. The 30 vdc resistive rating is 10 amperes, or 6 amperes for a motor.

Simulation Table Planned for Smooth Operation

The "Micro Gee" simulation table is designed for angularly displacing gyros and accelerometers, in pitch and roll, either statically or dynamically. Extremely smooth operation is obtained by using specially designed driven pendulum mechanisms.

The servo controlled table is used in conjunction with an analog computer to make "flight testing" of a complete aircraft or missile stabilization system possible on the ground, as contrasted to such programs where gyro and accelerometer dynamics are linearly simulated. In addition, the two-degree-of-freedom simulation table may be used as an oscillating table to determine the threshold characteristics of high performance gyros and accelerometers.

The table will follow signals such as those from an analog computer, a low-frequency function generator, a tape recorder, or a digital-to-analog converter, when these signals are applied to the input terminals of the dc power amplifier that drives the table.

Ratio Transducer Gives Accuracy Over Wide Range

A new Mach number and pressure ratio transducer utilizing design advantages of a force balance mechanism to provide exceptional accuracy has been developed by Burton Mfg. Co. The unit operates at very high altitudes and over wide temperature ranges and features freedom from bellows or diaphragm hysterisis effects and friction errors.

This basic system operates from −65°F to 185°F and to very high altitudes. Its accuracy is of a high order at critical operating points. The advice produces an electrical output to the ratio of static and pitot pressure input. However, it can be provided to produce electrical output in response to the ratio of any two independent pressures as an output, within the capacity of the instrument. The output can be through a synchro or a similar ac-type unit, or a potentiometer, depending on specific requirements.

In this transducer, bellows translate pressure into forces acting upon beams. Misplacement is sensed through an inductive pickoff, the signal of which is amplified. Through a servo loop, a fulcrum moves to a position

STRESS TO PRODUCE 0.1% PERMANENT DEFORMATION IN 150 HOURS

UNDER CONTINUOUS STRESS:

Creep can ruin your best designs!

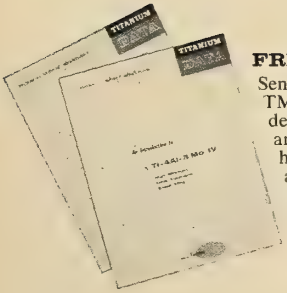
Whether your creep problem is sagging socks or stretching struts, the result is pretty much the same: Things don't hold their shape the way they should.

Garters we don't have. But we do have new titanium alloys which offer a rare combination of excellent creep resistance plus light weight (density 0.163 lb/cu. in.), great tensile strengths (to 175,000 psi), and outstanding corrosion resistance.

In bar and forging stock, there's Ti-8A1-1Mo-1V. Its short-time elevated temperature properties are similar to Ti-6A1-4V, one of the most widely used titanium alloys. Yet "8-1-1" offers as much as a tenfold increase in creep strength between 600° F, and 1000° F. This means that, for an equivalent stress level, Ti-8A1-1Mo-1V raises the effective operating temperature *150° F.*

In sheet stock, there's Ti-4A1-3Mo-1V, which offers excellent formability because of good tensile elongation, bend ductility, and low yield strength in the solution-treated condition. Yet this alloy can be heat-treated to strengths of 175,000 psi.

At Toronto, Ohio, Titanium Metals Corporation of America is now operating the world's only plant designed and instrumented solely for rolling and forging titanium. With this facility, TMCA can furnish you the best quality metal, on the fastest delivery schedule, at the lowest possible price in the industry today.



FREE:
Send for TMCA Data Sheets describing physical and mechanical properties, heat treatment methods, and other useful information about the new creep-resistant alloys.

Can this experience in unique cooling applications help solve a problem for you?

Custom designed cooling is our business at Ellis and Watts. For example, we have recently engineered and built highly specialized equipment for the following applications:

- Liquid coolers for electronic components (bulletin 94)
- Cooling Klystrons with air to liquid heat exchangers (bulletin 95)
- Special units to cool airborne electronic gear (bulletin 99)
- Cooling equipment for huge complex electronic computers (bulletin 102)
- Electronic console and rack coolers (bulletin 105)
- Small portable field units to cool huts filled with electronic gear for missile ground support, battlefield television, communications and radar (bulletin 106)
- Conditioning systems for Radome shelters (bulletin 108)
- Mobile cooling units for trailer-mounted electronic systems for missile and aircraft ground support (bulletin 111)
- Units to cool automatic landing devices for carrier and land-based aircraft (bulletin 122)
- Cooling equipment for fixed or mobile flight training simulators (bulletin 124)
- Dewpoint control equipment for pressurized radar waveguides (bulletin 128)

These are but a few examples. On land (MIL-E-5272A), on the sea (MIL-E-16400B), in the air (MIL-E-5400B) — even in outer space (MIL-E-8189A) — E-W specialized cooling equipment guarantees the performance of your electronic systems, independent of environmental conditions, for military or commercial applications.

If your project involves cooling . . . it's a job for Ellis and Watts. We are staffed with specialists who will analyze your requirements, submit a proposal, design and build equipment promptly and to your complete satisfaction. Field installation and maintenance services available.

Parabolic Antennas Include Mounts, Systems

A series of 19-foot parabolic antennas are available from Technical Appliance Corp., including various combinations of mounts and feed systems using the same reflector.

The reflector is made up of four pie-shaped sections to facilitate easy transportation to installation site. The individual sections are readily assembled into an extremely rugged structure. The structural base of the antenna is a circular ring truss 8 feet in diameter. Preformed radial members fan out from the ring truss to the tips of the reflector. Circumferential tubing is heliarc-welded to the radial members. A rigid ring circumvents the entire structure. Reflecting surface is ½″ expanded aluminum mesh, the entire antenna being iridited and painted for long-lasting finish.

A choice of ground mount or tower mount is available. Both permit azimuth and elevation adjustments through 10″ of travel. Standard feeds are either dipole or horn-type, and special feeds for specific requirements are available on order. In addition, the reflector is available without feed system and with or without mount.

Signal Simulator Checks Telemetering Ground Units

The ASCOP MSS-3 is an accurate and flexible laboratory standard for simulating PW signals of 30x30, 45x20, 60x15, and 90x10 configurations for the checking and calibration of telemetering ground stations. It is specifically designed for use in the testing of PW telemetering stations used in the aircraft and missile field, as well as for engine teststands, nuclear reactors, powerplants, and similar projects. The MSS-3 makes use of solid-state devices throughout, with transistors operating in the switching mode exclusively. It provides accurate PW test signals while containing no commutator, operating mechanical components, nor electronic tubes. Consequently, the life of the unit is neither dependent on mechanical considerations nor tube life. Both standard PW and a differentiated PW output to simulate PW/PM signals are provided.

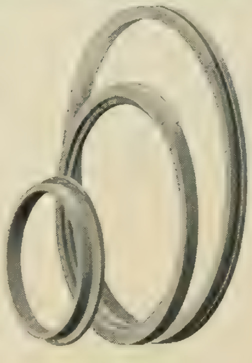
No place
here for
second best



Steel rings are important components of missiles, rockets, aircraft and engines—and here only the best are acceptable. "Seconds" won't do!

Edgewater prides itself on the dependable high quality of its rings. Weldless rings are rolled from solid blocks of steel by a process which produces fine-grain, uniform metal texture. Welded rings are precision-formed from extruded or rolled bars, and flash-welded by modern electronically-controlled equipment. Simple or complex ring sections are formed to close tolerances, thus reducing machining and scrap-loss. Diameters of weldless rings are 5 to 145 inches; welded rings, up to 48 inches.

We will be glad to send you our descriptive bulletins.

Glass Fiber Jet Vane Reinforced With Resin

American Aerophysics Corp. has announced the successful fabrication and test of a jet vane manufactured of laminated glass fiber, reinforced with phenolic resin. The Jet Propulsion Laboratories of the California Institute of Technology, designers of the jet vane configuration, have stated that tests in the rocket blast of a missile have proven extremely successful.

A unique arrangement of laminations was employed which produced superior resistance to the severe eroding environments within the rocket blast. Instead of laying the laminates in parallel, they were placed with their edges sloped in the direction of the jetstream in order to avoid separation or tearing of the individual laminates. An extremely high-strength phenolic resin was used as a binder.

Pinhole Coil Winder Does Miniscule Job

Stanford Research Institute has developed a machine capable of winding coils on torroidal cores almost invisible to the naked eye. The machine is capable of winding coils with an outside diameter equal to the diameter of the hole through which they are wound, either from the center to the outside of the core, or through two adjacent holes in the same core. The ability of the machine to wind such coils is not impaired by the diameter-to-length ratio of the hole, or holes through which the coil is to be wound. It would be possible to wind a coil through two 0.010" holes spaced on 0.060" centers in a 3"-thick core.

The wire forming the coil is made to pull itself through the hole or holes through which the coil is wound. The set up time on the laboratory model of the machine is about the same as on a standard commercial torroidal winding machine and can be reduced drastically on a production model. Actual winding time per turn is about equal to a standard commercial machine.

Resistor Design Change Reduces Noise Level

Reon Resistor Corporation has developed a completely new design in a molded composition potentiometer. The elimination of the wiper arm collector by use of a beryllium copper spring between the contact arm and the center terminal greatly reduced the electrical noise generated by all conventional potentiometers.

One moving point of contact, the carbon brush, on the resistance element reduces the noise to less than one-half and extends the rotational life of the potentiometer to over a million cycles. An overall resistance change of approximately 6.3% is average.

This potentiometer is manufactured to meet the "Y" characteristic of the new MIL R-94B specification, and is available in all tapers with both standard and locking bushings, as well as water-sealed units.

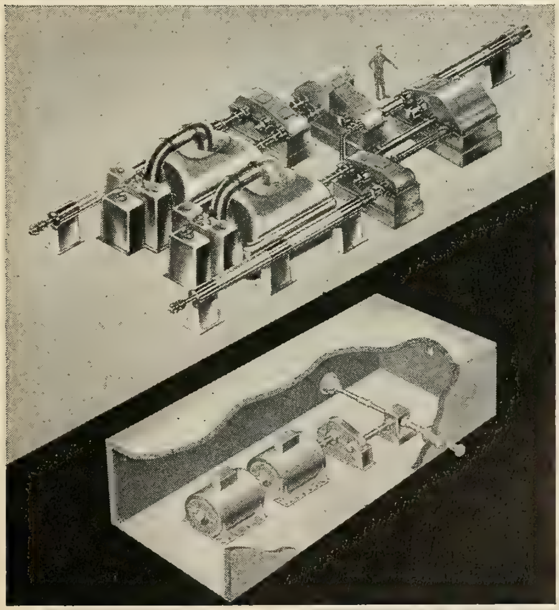
Here's a trunnion-mounted, multi-speed unit used with a dynamometer test facility for guided missile pumps. This unit has a top output speed of 60,000 RPM with a pitch line velocity in excess of 30,000 FPM or more than 340 miles per hour. Unit measures approximately 25 inches in length.

WESTERN GEAR

TEST STANDS and DRIVES...designed to

50,000 HP or 100,000 RPM

This giant test stand facility was designed for use by a leading Eastern aircraft manufacturer. The 2 steam turbines deliver 22,500 HP each. Top output speed is 9,000 RPM and the pitch line velocity is 30,000 FPM.



This test cell presented an "impossible" problem . . . how to transmit 3,000 HP at 7,000 RPM through a right angle gear box? The wall-mounted gear boxes are provided with quick change gear sets which can be shifted from 7,000 to 11,000 and 17,000 RPM. Inspection after unprecedented hours of service show the gearing to be in excellent condition.

Circle No. 68 on Subscriber Service Card.

Western Gear is designing and building drives and test stands for leading missile-components manufacturers and development laboratories ranging up to 50,000 H.P. or 100,000 RPM. Successful tests have carried designs to 200,000 RPM. Pictured on this page are three recent applications. Note the coupon below.

the unit, with a guaranteed accuracy of 0.0005 ratio, can be utilized on potentiometer output instruments, voltage dividers, initial condition dividers for analog computers and many other precision jobs.

Designated model 700100-2, the ratiometer is designed for either laboratory or field use. It operates on normal 60-cycle line voltage. The self-balancing feature allows the operator free use of both hands for instrument adjustment while continuously observing the potentiometer wiper position. A null indicating light is mounted on the front panel for positive indication of a null condition. A switch allows channel selection for simultaneous checkout of two instruments.

Dual Output Generator for Missile Electric Power

The Ruckstell Corp. has completed development and is producing a new high-performance generator for missile electrical power. The dual-output permanent magnet, 24,000-rpm, ac generator produces 5 kva of 3-phase, 400-cps, 20/208 volt, and 3.4 kva of 6-phase, 1600-cps, 23-volt power which is rectified to direct current.

Using a lightweight, static-type voltage regulator to supply a toroidal back-winding, the 400-cps voltage is maintained constant with 0.5 volts for all steady load conditions and has a rapid transient response, recovering from full-load switching in 0.1 second. The rectified direct-current output has an inherent regulation of 26 to 30 volts dc. Overall efficiency of the generator is 90%, and greater reliability and lighter weight are achieved by the elimination of the exciter, brushes and slip rings.

New Plastic Tubing Zips Off or on Wires

Designed specifically for use in the electronic circuits of missiles and aircraft, nylar zippertubing is being manufactured by The Zippertubing Co. The product is said to be less expensive and easier and faster to install than conventional tubing coverings requiring pulling wires through tubing or short extruder runs. Used as a protection for existing installed wires, cable or tubing, or as a cable jacket or shield, the new tubing saves up to 90% of installation costs and permits accessibility to workpoints when required.

By laminating mylar zippertubing with aluminum, it is possible to construct shielded cable quickly without the use of additional equipment. The product is available in any desired size from 3/8" to 4" in 1/8" increments

Specialists in the Manufacture of
HIGH PRECISION MACHINE PARTS
SINCE 1908

The equipment you are designing or building may well include a number of small high precision machine parts, and you will be anxious to see that they are produced by a firm in which you can have complete confidence. A firm competently staffed, well equipped, with years of experience, and a reputation for high quality production and complete dependability. LaVezzi, with a history of many years in this specialized field is the answer to this need, and earnestly solicits your quote requests. An illustrated brochure will be mailed promptly upon request.

(I.D.) and has an external flap for bead protection. It supplants vinyl zippertubing for use in applications that require wire, cable, or tubing protection against the harmful effects of chemicals.

Clear or metallic-colored mylar zippertubing is available in lengths from 20 to 30,000 feet. Other colors are available upon request. When sealed, the tubing will withstand a lateral pull strength of 60 psi.

Circle No. 230 on Subscriber Service Card.

Flow-Control Valve Permits Precise Control

A new, low-cost flow-control valve, said to permit precise control of air, gas or low pressure hydraulic flow with unrestricted return is being produced by Valvair Corp. Known as the Valvair Micro-Trol, the new valve features locked screw adjustment and a unique combination of controlling elements, a threaded stem and molded nylon flapper. The lower range of flow rates is metered by adjusting the position of the ground cylindrical stem within a concentric bore in the valve body.

As the regulating portion of the stem clears the bore, the stem end contacts the flapper, lifting it off its seat. Flow is then controlled by the clearance between the flapper and seat. Thus, flow is regulated with fine adjustment, from cutoff to full flow. On return, the flapper lifts clear, affording unrestricted passage of the controlled medium. Flow-rate adjustment is retained by an external lock nut on the slotted adjusting stem.

Valvair Micro-Trol valves are available in sizes ranging from ¼ in. through ¾ in. NPT. Flow area through the valve is said to exceed nominal rated pipe size. Valve body is of cast Navy M bronze, stem is stainless steel and the flapper is molded nylon. An O-ring seals and retains the stem.

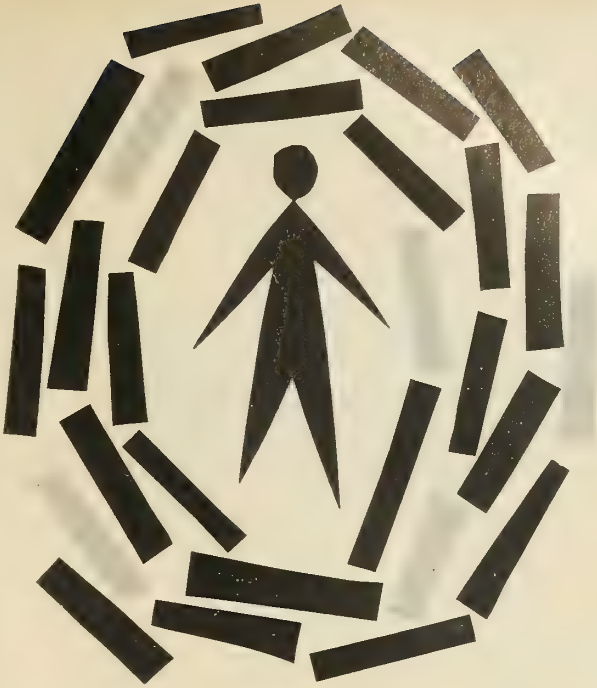
Motor-Generator Produces Exact 400-Cycle Frequency

A small motor-generator set has been developed recently by the research department of Kato Engineering Co. for use in conjunction with military missile development programs. The generator portion of the unit produces an exact frequency of 400 cycles per second. It is single phase and rated at 1100 watts. The generator is self-regulated with voltage change kept within



THE
ELEMENT
OF
ENVIRONMENT

and the Circuit Design Engineer

To one looking beyond the four walls of his office, environment might be defined as the sum of (1) work responsibilities and (2) colleague personalities.

The Circuit Design Engineer we seek could not fail to be stimulated by (1) assignments of a most advanced nature and by (2) colleagues with considerable attainments in systems engineering, behavioral sciences and computing.

To qualify, at least three years' experience in general circuitry design in both tubes and transistors is required. Experience should encompass areas such as video and pulse circuits, cathode ray tube displays and analog and/or digital computer techniques.

You are invited to write for more information or phone collect. Address R. W. Frost, System Development Corporation, 2414 Colorado Avenue, Santa Monica, Calif.; phone EXbrook 3-9411.

Hose Built to Handle Fuming Nitric Acid

Hewitt-Robins, Inc., has developed a hose capable of handling fuming nitric acid missile fuel. The new hose is lined with a tube made of Teflon fluorocarbon resins capable of withstanding the chemical action and high temperatures encountered in the handling of fuming nitric acid. The fluorocarbon tube is reinforced with fabric and covered with a blend of natural and synthetic rubbers bonded to the tube. The hose will withstand temperatures up to 500°F. It is available with stainless steel fittings in diameters ranging from ½ to 3 in. and in lengths up to 75 ft.

Micro Switch Shows New Rotary Selection Switch

A new series of environment-proof subminiature rotary selector switch assemblies has been announced by Micro Switch Division of Minneapolis-Honeywell Regulator Co.

Small size is combined with complete-seal construction and precision multi-circuit switching. The assemblies, designated the 25AS series, are especially suited for use on aircraft and electronic control panels where space is at a premium. Dependable operation can be obtained in a temperature range of −65° to +212°F, the company claims.

The rotary selectors are supplied with from one to eight of the lightest environment-proof switching units. From two to eight detent positions are offered. The detent mechanism imparts a positive "feel" between each detent. There is a 45° angle between detent positions.

The precision switching units are sealed with an elastomer seal which is bonded to the pin plunger and alumi-

HIGH-ENERGY FUEL BRIEFS FROM CALLERY

The Callery countdown has begun. When it reaches zero, two new fuel plants will stand ready to produce HiCal, trade-name for our high-energy zip fuel. The fuel from both plants will be HiCal 3, a liquid boron-carbon-hydrogen fuel for aircraft and missiles.

PLANT CONSTRUCTION ON SCHEDULE
One of two new plants is under construction at Muskogee, Oklahoma; the other at Lawrence, Kansas. Both plants are on schedule. The first units of the Callery-financed Lawrence plant were put into operation on April 1. And the plant at Muskogee — the one we're building for the Navy — should be finished by the end of 1958.

TARGET DATES FOR PRODUCTION
After reasonable lead-time to start the plants up, we anticipate fuel production at Lawrence by mid-1958 and some production at Muskogee early in 1959.

A WORD ABOUT AVAILABILITY
Distribution from the Navy-owned Muskogee plant will be handled by the Navy. No commercial sales foreseeable here. And while the fuel capacity from Callery's Lawrence plant is virtually all committed *now*, there may be quantities of fuel available in the *future* for authorized users.

ALSO ON TAP
We will also produce these other chemicals of interest to the propulsion field: Decaborane, Diborane, Triethylborane, Amine-Boranes and TMB. TMB is a metal fire extinguishent. It is effective against magnesium, zirconium and titanium fires. Still other chemicals of interest — primarily to the chemical industry — will be available in production quantities.

HOW WE CAN SERVE YOU
Although we will be fuel and propellant manufacturers ourselves, we would be very glad to consider *your* expected future large-scale requirements for fuel and propellant intermediates. When need for such materials becomes apparent, please get in touch with us.

Pressure Calibrators For Transducers

Wallace & Tiernan Inc. have developed improved types of precision aneriod and dial type manometers for use as portable calibrators of pressure transducers.

Models of the calibrators have absolute pressure ranges starting at zero to 31.5 in. of mercury absolute and extending as high as zero to 150 inches of mercury absolute. Differential pressure ranges start at 0 to 120 inches of water and extend to 0 to 300 in. of mercury. The accuracy of all models is 0.1% of full-scale range. Readability and sensitivity to pressure change is one part in 10,000 and hysterisis has been reduced to a minimum.

Circle No. 274 on Subscriber Service Card.

High-Speed Pump Features New Gear Design

A high-speed hydraulic pump featuring a new gear design has been introduced by Hupp Aviation Co. Designated the Hupp Hydroid Pump, the unit features gears with an elliptical profile that eliminates trapping of liquid between teeth.

The patented gear design is the first to be developed exclusively for pumping fluids instead of for power transmission, according to the manufacturer. The nontrapping feature permits speeds in excess of 4000 rpm with hydraulic pressures of more than 1500 psi. Flow rates from three to more than 250 gallons per minute are available for specific applications.

Ability to operate at high speeds eliminates need of costly reduction gearing accessories on hydraulic applications. It is expected designs will be tailored for uses where higher pressures, quieter operation and gear pump economy are required.

Maintenance Kit Labels Lubrication Points

A plan of preventive maintenance for marking lubrication systems has been developed by the Meyercord Co. of Chicago. The plan provides for positive identification of lubrication points on machine tools, as well as on lubrication equipment and bulk containers. The markings are special type transfers, known as Lubri-Cals. They are resistant to abrasion, weathering, oil immersion and temperature variations. The kit consists of a total of 4276 markings which provide the proper frequency of numerals, letters and instruction nameplates for identifying lubrication points and for specifying the required lubricants for each application. Numerals are placed adjacent to the lubrication point on the machine along with a letter denoting the required lubricant.

Readout Counter Has Life of 300 Million Counts

A high-speed electro mechanical switch readout counter with a life expectancy of 300 million counts and offering switch readout function on each point of its five digital wheels has been developed by Autron Engineering, Inc. Now in production the Neuron switch readout counter features rates to 40 counts per second and is available with either manual or electrical instantaneous pulse reset. Also available are models responding to a variety of ac and dc actuation voltages.

Intended for industrial high-vibration and heavy g-load airborne applications, the counter has a bidirectional stepping mechanism which cannot double-index during shock, vibration or overvoltage.

Autron claims the switch contact life is 50 million operations at recommended ratings. Static switch current capacity is 1 amp and the dynamic switch current capacity is 100 milliamps.

Lightweight Fuel Control For Missile Powerplants

Chandler-Evans Division of Pratt & Whitney Co., Inc., has developed a series of lightweight low-cost fuel controls for use on small gas-turbine powered missiles and target drones. Known as the model MC fuel control series, each unit is simple in design and incorporates a pneumatic speed governor which enables it to maintain constant speed from sea level to 60,000 feet.

Each unit is a unitized fuel system incorporating a positive displacement gear pump, a metering valve and a bypass valve.

Circle No. 281 on Subscriber Service Card.

Sensitive Transducer Features Reliability

Servomechanisms, Inc. has designed a pressure transducer, designated SMI type TR 719, for conversion of an ac excitation to a dc output signal that is proportional to differential or absolute pressure. The unit has been made for use in telemetry pressures such as aerodynamic, powerplant or hydraulic systems. It can also be employed in various other applications such as the sensor in a dc feedback loop. It is said to be ideally suited for high accuracy and high environmental missile requirements where standard potentiometer transducers exhibit excessive friction, resolution and unreliability.

The unit operates in the ranges from 15 to 3000 psi and the manufacturer states that its design allows accurate and reliable operation under relatively high shock, vibration and acceleration.

Circle No. 282 on Subscriber Service Card.

Power Supply Fills Precision Requirements

A transistorized power supply developed by Southwestern Industrial Electronics Co. has been made available for any desired output between 1 and 25 vdc. Rated output current is 350 ma and the regulation over the entire input voltage and output current ranges is 1%.

The 120 vac input is reduced through a specially designed SIE transformer, rectified in a bridge circuit and filtered. The aluminum case contains output terminal connections, switch, pilot light, and a 0.25v adjustment control on an anodized front panel.

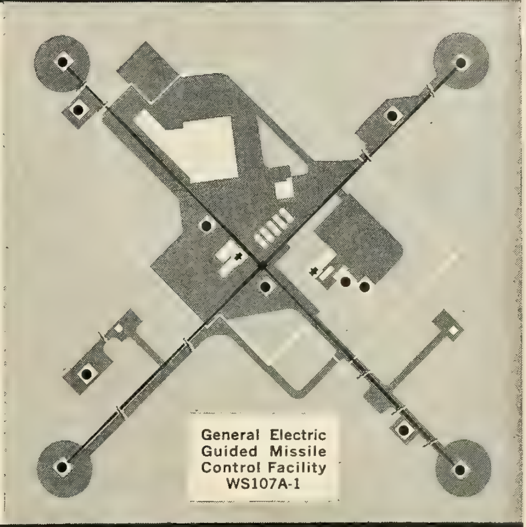
GRADUATE EE'S: GENERAL ELECTRIC DISCLOSES HIGH PRIORITY PROGRAM FOR ATLAS

GUIDANCE SYSTEM. MANY POSITIONS OPEN IN ELECTRONIC MISSILE TECHNIQUES=

ACCURACIES ON ORDER OF 1 PART IN 10 MILLION

required for portions of G.E.'s ICBM ATLAS Guidance System



General Electric
Guided Missile
Control Facility
WS107A-1

Delivering an ICBM over a > 5000 mile trajectory into the target area demands a guidance system of unprecedented accuracy—and this is the calibre of the electronic system General Electric engineers are creating for ATLAS.

But achieving designated accuracies and reliabilities in the laboratory is not enough. *These high standards must be maintained in actual operational environments, with virtually no interruption or degradation.*

CAREERS IN STEP WITH THE FUTURE

Engineers who join the Missile Guidance Product Section of G.E. are doing more than hastening development of one of the nation's most urgent programs — guidance for ATLAS. As Manager of the Section Richard L. Shetler states: *"With this job behind us, there will remain no significant obstacle to the practical guidance and navigation of other space vehicles."*

PROGRAM ACCELERATION OPENS UP WIDE RANGE OF POSITIONS IN:

- Systems analysis, evaluation & integration
- Systems and component reliability
- Transistorized circuits, pulse circuitry, IF-Video circuits
- RF and Microwave components & plumbing
- Communications control devices
- Doppler radar design & development
- Digital data processing techniques, data transmission involving D & D of ground-based & airborne antennae, transmitters, receivers; application of transducers, transponders, etc.
- Test operations, including planning, range instrumentation & test execution; development & application of automatic test equipment

If you feel that your special skills and interests fit you to work in any of the above areas, why not write us in detail? Qualified candidates will be invited to visit our facilities to meet with technical managers and gain first hand knowledge of the living advantages of our locations at Syracuse and Utica, N. Y.

Write in complete confidence to Mr. E. A. Smith, Room 4-G

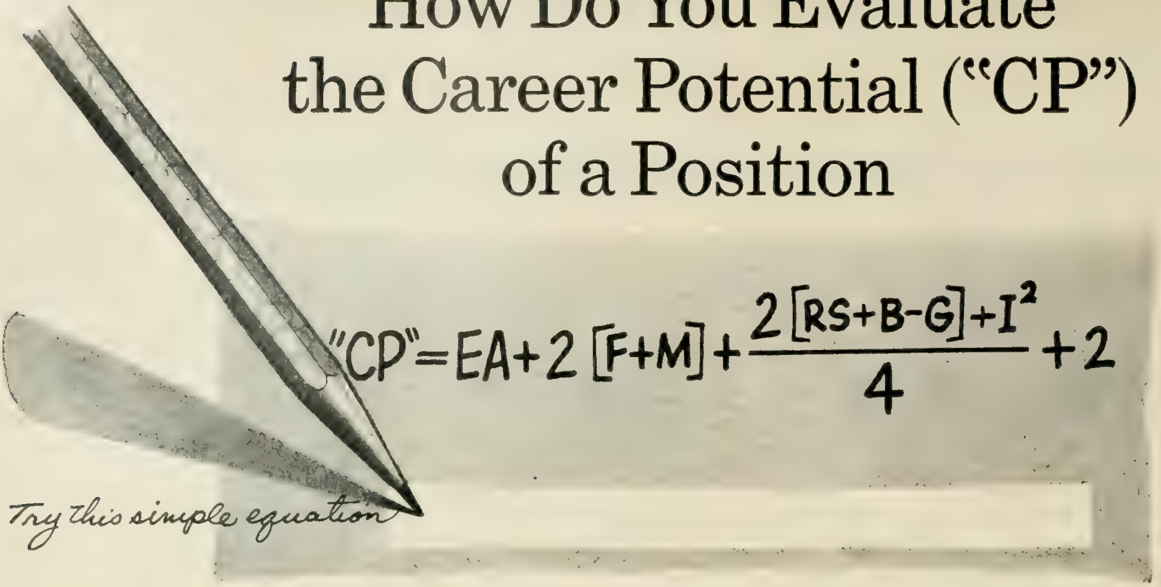
How Do You Evaluate the Career Potential ("CP") of a Position



$$\text{"CP"}=EA+2\left[F+M\right]+\frac{2\left[RS+B-G\right]+I^2}{4}+2$$

Try this simple equation

My Present "CP" = ____________

"CP" VALUES; to test your "CP," circle the value you'd give each symbol below, substitute, AND SOLVE. *(Top value obtainable, 99.5)*

	"CP" VALUES	LOW			HIGH
E	Encouragement to Exercise Initiative & Creative Imagination	2	3	4	5
A	Assignment (Nature of)—from Routine to Very Challenging	5	6	7	8
F	Field—Conventional Product to Area where Technical Breakthroughs Expected	2	3	4	5
M	Modern Facilities—from Limited to Extensive Equipment for Testing and Research	2	3	4	5
R	Recognition of Individual Contributions—Chief Reason for Advancement	2	3	4	5
S	Salary—from Unsatisfactory to Excellent for Level of Work	5	6	7	8
B	Benefits—from Limited to Best in Industry, including Encouragement to Join Professional Societies; Liberal Support for Graduate Study	2	3	4	5
G	Increases—Primarily by Seniority Rather than Merit.	2	3	4	5
I	Your Individual Skill, Creativeness and Ability to Take Responsibility	5	6	7	8

If your solution is 85 or less, it will be worth your while to inquire about the new opportunities in research and development now open at Republic Aviation.

These are specialist positions—requiring men of high calibre and a strong background of experience for advanced work on supersonic and upper atmosphere projects in aircraft, missiles and space vehicles.

The Department Head in your field will personally study your resume. If he feels there is an opening here which will engage your interest and fit your qualifications, he will arrange for an interview. And provide you with specific information—with which to evaluate your Career Potential at Republic.

DATA PROCESSING SPECIALISTS

missile flight testing is a big business . . . bigger than ever before . . . and the Engineering Services Division of Telecomputing, with more than ten years of continuous and highly specialized service in this field, offers exceptional employment opportunities at Holloman Air Force Base, New Mexico.

This is an exciting business. At the White Sands Proving Ground Integrated Range missile tests are an everyday occurrence. We salute those who design and develop today's advanced missiles. Here, we are a part of the culmination of their work.

Our job is to compute the performance of missiles in flight. Our output—authentic, concise, and accurate reports—contributes substantially to the advance of the missile sciences, and enables the Armed Services and Missile Contractors to evaluate field performance. The need for rapid and accurate analysis and evaluation of data is greater than ever before. So, it follows that our people are not only abreast of the state-of-the-art in data processing, but, in a very real way, it is we who establish the state-of-the-art, and keep it constantly moving forward.

Specialists of the Engineering Services Division are associated with the use of the most modern scientific data measuring and processing systems—cinetheodolites, electronic measuring systems, telemetry, precision optics, and optical to digital converters. The output of these instrumentations are processed through the use of high-speed digital computers and other advance design data reduction equipment.

Make your home in New Mexico's land of enchantment • Mountain skiing and resorts just 30 minutes away • Attractive salaries with area bonus • Profit sharing • Relocation pay • Group insurance

For additional information about any product or service advertised or mentioned in the editorial pages of this issue of Missiles and Rockets:

Use the attached prepaid reply cards. Circle numbers shown on the reply card that correspond with numbers appearing beneath items described. If no circle number accompanies the article or advertisement, give page number (and advertiser's name) on line provided at bottom of the card.

Your requests for information will be forwarded promptly to the companies concerned.

NEW PRODUCT BRIEFS

LIMIT SWITCHES. Hermetically sealed limit switches offer operation from—65° to 600°F and consist of corrosion-resistant metal enclosure protecting a double-pole double-throw switching unit. MICRO SWITCH.

Circle No. 247 on Subscriber Service Card.

SOLDERLESS TERMINALS. Rectangular tongue solderless terminals in insulated or noninsulated types are designed for hard-to-reach applications. Available for 22-16 and 16-14 size wires, the units have full 1/4" working shank and V-type groves in throat for firm grip and vibration proof connection. Constructed of pure cooper and electro-tinned for maximum corrosion resistance. Other plating may be specified. Hollingsworth Co., Solderless Terminal Div.

Circle No. 248 on Subscriber Service Card.

SYNCHROVERTER CHOPPER. Low-noise miniature chopper features low thermal construction and particularly suited to chopper-stabilized d.c. amplifiers where thermal stability and extremely low noise are vital. Has complete electrostatic shielding of the coil from the contact assembly, embodies modular construction and has operating range frequency of 0-700 cps. Thermal stability under general laboratory conditions is less than —2 microvolts. The Bristol Co.

Circle No. 249 on Subscriber Service Card.

ALUMINUM OXIDE CERAMIC. Non-porous 99.0% aluminum oxide ceramic material exhibiting 30% more strength than the best commercial high aluminas of 96% to 98% aluminum oxide. The material has a tensile strength of 34,000 psi, or as strong as cast iron. It retains 75% of this tensile strength (20,000 psi) at 2000°F. The material, designated Coors AD-99, is said to be a superdielectric, with a loss factor lower than tetrafluoroethylene resins. The AD-99 ceramic is available on a production basis from Coors Porcelain Co.

Circle No. 250 on Subscriber Service Card.

SILICONE FLUID. A new methyl phenyl silicone fluid capable of withstanding more than 1000 hours exposure to air at 250°C without decomposing or jelling has been marketed by GE. Designated 81705, the fluid is applicable over the temperature range —40 to 500°F. It has low volatility, high flash point, good electrical properties and good lubricity. General Electric.

Circle No. 251 on Subscriber Service Card.

RECTILINEAR POTENTIOMETER. This unit, designed for a variety of missile applications, including hydraulic actuators, motor gimbals and control surface indication is said to be particularly adaptable where linear position measurement is required under difficult environmental conditions. The device will operate accurately under vibration conditions up to 20 g's in temperature environments up to 275°F. Servonic Instruments Inc.

Circle No. 252 on Subscriber Service Card.

MOUNTING SYSTEM. Lightweight standardized mounting system designed for the protection of fuel control equipment from destructive vibration and shock in high temperature propulsion section of missiles. Robinson Aviation, Inc.

Circle No. 253 on Subscriber Service Card.

UMBILICAL DISCONNECTS. Designed specifically for missile umbilical disconnects or other severing functions where guillotine choppers are not feasible, this explosive electrical disconnect is designed around the 55-circuit Bendix pygmy connector. It converts the pygmy unit into a reusable explosive-actuated device without altering the electrical characteristics of the original connector. Beckman & Whitley, Inc.

Circle No. 254 on Subscriber Service Card.

SHUTOFF VALVE. Manual shutoff valve model 949T for high pressure gas systems materially exceeds valve requirements of MIL-C-2680. Primary features of the valve include easier operation with threads out of fluid stream above the stem seal, reduced operating torque and increased depth of finger indents in handle. Provides positive, leakproof shutoff by means of a resilient O-ring; yet the O-ring is withdrawn completely and automatically from the fluid stream as soon as the valve begins to open. Throttling is accomplished by a conical metal plug which varies the orifice area. James, Pond & Clark, Inc.

Circle No. 255 on Subscriber Service Card.

PHASE METER. Phase accuracy of 1° from 10 cps to 10 kc is a feature of a transistorized phase meter designated model 328-A. Operating characteristics include long-time stability, frequency range from 10 cps to 50 kc, direct reading from 0° to 360° in 6 ranges of 60° each on a 5" meter scale, recorder connections and operation from an external 45-volt battery, if desired. Acton Laboratories.

MISSILE LITERATURE

ACCELERATION TESTS. An illustrated folder covering centrifuge acceleration test equipment, giving specifications, performance data and accessory information has been published by the Rucker Co.
Circle No. 200 on Subscriber Service Card.

TAPE RECORDER. Sixteen-page brochure on the model 800 airborne magnetic tape recorder describes the equipment and gives complete specifications and operating features. Photographs and a tabular presentation of the various data requirements are included. Ampex Corp.
Circle No. 216 on Subscriber Service Card.

STAINLESS STEELS. Product data sheet discussing magnetism of wrought and cast stainless steels and its relation to corrosion resistance is available from Alloy Steel Casting Co.
Circle No. 201 on Subscriber Service Card.

THERMO-PANEL COILS. Bulletin describes new type of unit to replace standard pipe coils in heating or cooling processes. The panels consist of two metal plates, embossed and welded together to form flow channels. Bulletin gives design features, price information and various other data. Dean Thermo-Panel Coil Division.
Circle No. 202 on Subscriber Service Card.

SMALL BUSINESS PROBLEMS. Research and problem-solving in small businesses are treated in this report for the Office of Technical Services. Report states that small- and medium-sized manufacturing firms depend to a large degree on the large firms who supply them with raw materials and equipment for the solution of their technical problems. Department of Commerce.
Circle No. 203 on Subscriber Service Card.

CERAMIC FABRICATION. Recently published book representing the combined knowledge of 22 specialists and providing details on both the technical basis and present practice in the field of ceramic fabrication processes. Priced at $9.50, the book is available from John Wiley & Sons, Inc.
Circle No. 204 on Subscriber Service Card.

POLYETHER FLEXIBLE FOAMS. Technical bulletin containing six pages of new fundamental data on the formulation, preparation and curing of polyether flexible foams, together with a summary of the properties and performances of the resulting products. Data is given in tabular form and a 90-day graph on the effect of humid aging is included. National Aniline Division.
Circle No. 205 on Subscriber Service Card.

ALUMINUM SHEET AND PLATE. Illustrated 320-page volume includes aluminum's characteristics and practical application for a variety of sheet and plate fabricated parts and assemblies. Book describes aluminum's availability, physical and chemical attributes, production methods and alloys. Kaiser Aluminum & Chemical Sales, Inc.
Circle No. 206 on Subscriber Service Card.

TUBE FORMING. Catalog covering tube-forming facilities of Aeroquip Corp. and giving case histories of customers' tube requirements and fulfillment by Aeroquip. Engineering data, design hints for engineers and illustrations of tube-producing machinery are included. Aeroquip Corp.
Circle No. 207 on Subscriber Service Card.

PERMANENT MAGNETS. Loose-leaf style illustrated handbook fully covers the nature, characteristics and economic uses of permanent magnet materials. It contains sections on permanent magnet design, magnetic measurements, theory of ferromagnetism, and electromagnetic theory, among other subjects. Includes a 125-page specifications and data section presenting nominal magnetic, physical and mechanical data as well as other information. Supplemental data will be mailed to keep the volume up to date. Crucible Steel Co. of America.
Circle No. 208 on Subscriber Service Card.

MISSILE TRACKING CAMERA. Full technical details on the Gordent 200 camera which measures 6" long, 3½" high x 2½" wide. Camera is intended for missile tracking, testing and airborne flight-data recording. Literature covers high-speed magazines as well as optical and other accessories. Gordon Enterprises.
Circle No. 209 on Subscriber Service Card.

PRINTED CIRCUITS. Booklet listing some suggestions on printed circuit layout and design. Based on production experience and incorporating information not readily available in standard literature. Ansley Mfg. Co.
Circle No. 210 on Subscriber Service Card.

RUBBERIZED ABRASIVES. Industrial catalog lists rubberized abrasives for deburring, smoothing and polishing operations. Describes nature, uses and other data on product. Cratex Mfg. Co.
Circle No. 211 on Subscriber Service Card.

CALIBRATOR & TESTER. Four-page brochure details performance and specifications of impact wrench calibrator and tensile tester. Describes uses in checking fastener strength, calibration and maintenance of power wrenches, and setting assembly torque standards. Skidmore-Wilhelm Mfg. Co.
Circle No. 212 on Subscriber Service Card.

FREQUENCY MEASUREMENTS. Data file 111, describing methods of measuring low to UHF frequencies, rotational velocity, flow, pressure, temperature and strain. Covers telemetry and setting up secondary standards of frequency. Uses graphs & charts liberally. Beckman/Berkeley Division.
Circle No. 213 on Subscriber Service Card.

ELECTRONIC REQUIREMENTS. A guide to environment design requirements in research and development of electronic parts has been prepared by the Defense Department. The volume deals with related test procedures, components under nuclear radiation, missile components and highly specialized components. Data is given for temperature, pressure, moisture, vibration, shock, acceleration, explosive atmosphere, sand and dust, salt atmosphere, flammability, nuclear radiation and fungus resistance. OTS, Department of Commerce.
Circle No. 214 on Subscriber Service Card.

MECHANICAL RUBBER. Bonding of molded mechanical rubber to metal (including aluminum), compounding of rubber for tailor-made jobs, and uses of metals when cushioned with rubber where metal-on-metal cannot be used, are described in a 24-page illustrated booklet available from Henry Engineering Co.
Circle No. 215 on Subscriber Service Card.

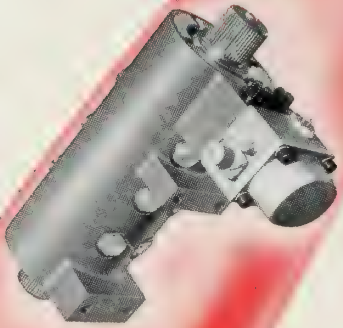
ROTARY ACTUATORS
by HOUDAILLE

FOR MISSILE AND AIRFRAME APPLICATIONS
— wherever rotary motion is required

. . . *save* **WEIGHT**
. . . *save* **SPACE**
. . . *save* **DESIGN TIME**

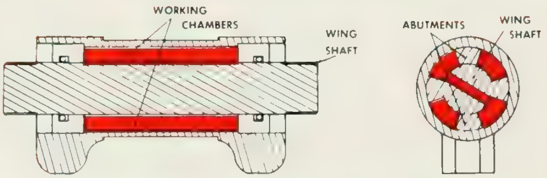


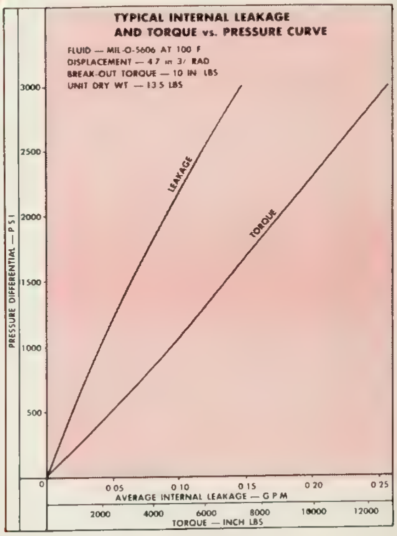
Lightweight rotary actuators by Houdaille will fit envelopes too small for conventional linear types . . . for hinge-line mounting with direct rotary torque output, without mechanical conversion. They eliminate undesirable backlash and provide the most simplified actuating system.

OUTSTANDING FEATURES OF
HOUDAILLE ROTARY ACTUATORS INCLUDE:

- Low internal leakage and high stiffness
- High mechanical efficiency and low static friction
- Output directly proportional to input
- Completely sealed against external leakage, dirt, dust
- Hydraulic damping to prevent vibration (optional)

TYPICAL DESIGN FEATURES
COMPOSITE VIEW





TYPICAL INTERNAL LEAKAGE AND TORQUE vs. PRESSURE CURVE

FLUID — MIL-O-5606 AT 100 F
DISPLACEMENT — 4.7 in 3/ RAD
BREAK-OUT TORQUE — 10 IN. LBS
UNIT DRY WT — 13.5 LBS

Bendix-built Talos Guided Missiles on the Navy's "U.S.S. Desert Ship" at White Sands Proving Ground—Official U.S. Navy Photo.

HOW THE MANY BENDIX MISSILE CAPABILITIES ARE IMPORTANT TO NATIONAL DEFENSE

Bendix* has been meeting and solving missile problems for many years. In addition to building the Talos, a U. S. Navy ground-to-air missile, we engineered and developed many of the major systems used in other key missiles. These include warheads, target-seekers, propulsion devices, controls, guidance and telemetering systems. Telemetering systems enable missiles to send back reports from space. More than 500 different channels of information can be transmitted, such as speed, direction, acceleration, roll, vibration, temperature, etc.

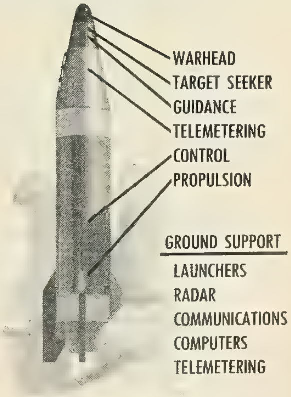
The Talos, for which Bendix is prime contractor, has, according to a Navy statement, "demonstrated a remarkably high degree of accuracy and reliability". As a result, the Navy is making direct shipboard installations on first-line cruisers without the intervening step of evaluation. This has meant a considerable money saving and has advanced this missile as a fleet weapon. It will be the major armament of the United States cruiser *Galveston* and will also be installed on a number of other cruisers, including the nuclear-powered *Long Beach.*

Because of the accuracy and extreme range of the Talos, the U. S. Army is also studying the feasibility of incorporating it into the Continental Air Defense System.

In addition to missiles and missile components, Bendix manufactures important Ground Support systems and devices.

Looking to the future, Bendix is engaged in an intensive *long-range* program, designed to help keep America foremost in the development of weapons vital to the preservation of our security and world peace.

*TRADEMARK

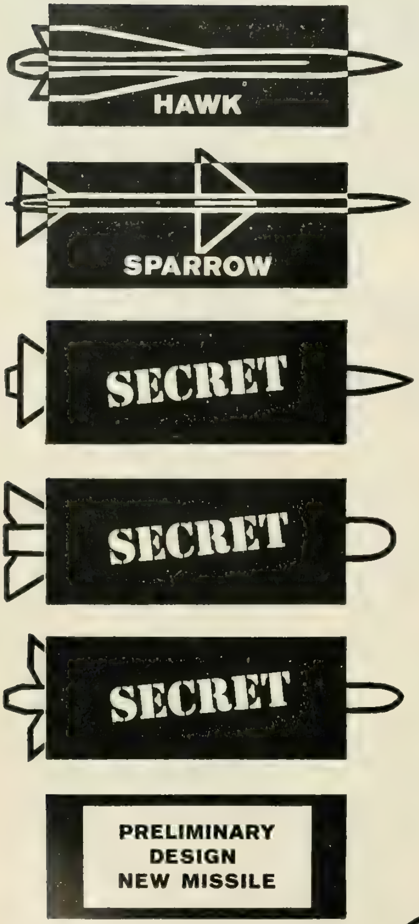


Bendix furnishes major elements for missiles of all types. This illustration represents no particular missile, but shows the general location of various airborne Bendix systems and their components. In addition, Bendix produces the Ground Support systems indicated above.

A thousand products Bendix *a million ideas*

AVIATION CORPORATION
Fisher Bldg., Detroit 2, Mich.

WORK IN RAYTHEON'S
EXPANDING
Missile Program



As one of the largest and fastest growing companies engaged in missile work, Raytheon offers unusual opportunities for challenging assignments to:

AERONAUTICAL ENGINEERS
MECHANICAL ENGINEERS

Continued expansion of our development programs and advanced missile design projects offers outstanding opportunities at all levels to experienced engineers desiring assignment in these fields:

AERODYNAMICS (Missile)
  Stability and Control
  Performance
  Air loads
WIND TUNNEL TESTING
DIGITAL PROGRAMMING
AERODYNAMIC HEATING
ROCKET ENGINEERING (Solid)

Consider these overall benefits at Raytheon:

- High starting salary.
- Excellent advancement opportunity.
- Modern facilities.
- Suburban New England living, ½ hour from Boston.
- Educational opportunities at M.I.T., Harvard, etc.

For interview at our suburban laboratory in Bedford, Mass., write, wire, or telephone collect to CRestview 4-7100. Ask for J. Clive Enos.

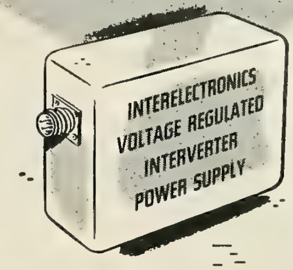
DC to DC and DC to AC solid-state power converters voltage regulated, frequency controlled, for missiles, telemetering, gyros, servos



Interelectronics Interverter solid-state thyratron-like elements and magnetic components convert DC to any number of voltage regulated or controlled frequency AC or filtered DC outputs from 1 to 1800 watts. Light weight, compact, 90% or better conversion efficiency.

Ultra-reliable in operation, no moving parts, unharmed by shorting output or reversing input polarity. Complies with MIL specs for shock, acceleration, vibration, temperature, RF noise.

Now in use in major missiles, powering telemetering transmitters, radar beacons, electronic equipment. Single and polyphase AC output units now power airborne and marine missile gyros, synchros, servos, magnetic amplifiers.

Interelectronics — first and most experienced in the DC input solid-state power supply field, produces its own solid-state gating elements, all magnetic components, has the most complete facilities and know-how—has designed and delivered more working KVA than any other firm!

For complete engineering data write Interelectronics today, or call LUdlow 4-6200 in N. Y.

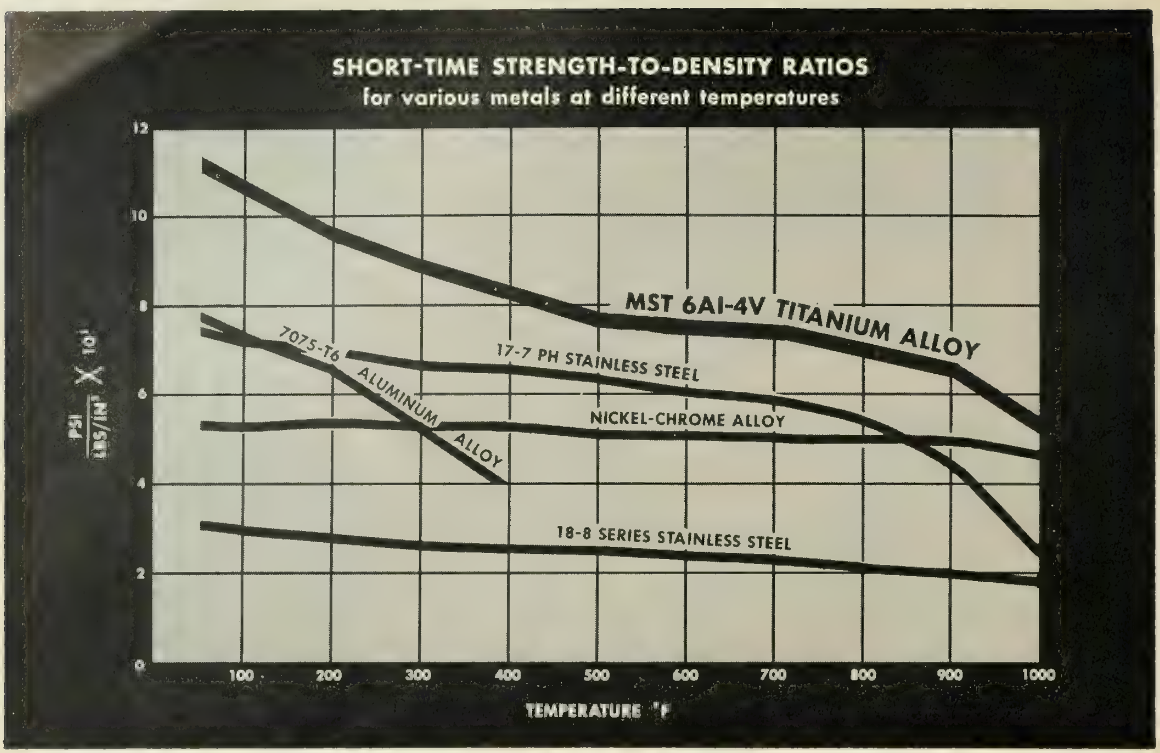
Progress with **TITANIUM**



TITANIUM ON TOP

in medium-high temperature range

Today's most popular titanium alloy, MST 6Al-4V, excels all other metals in strength to density ratio through 900°F. At room temperature, considering only strength, a part made of this alloy need have only 60% of the weight of the equivalent part in stainless steel.

Performance for extended times at elevated temperatures is likewise good. In typical creep tests, with 1% permanent deformation allowed, MST 6Al-4V alloy shows 100,000 psi allowable stress at 750°F for 1 hour; 77,000 psi at 100 hours; 65,000 psi at 1000 hours.

Meanwhile new alloys extending the elevated temperature usefulness of titanium—to as high as 1000°F—are now emerging from the laboratory into production.

Write Dept. C-5 for copy of "Titanium Alloy Properties"

SELECTION GUIDE TO MST ALLOYS

Typical Mechanical Properties of Annealed Titanium and its Alloys

	Form	Ultimate Tensile Strength, psi	Yield Strength, psi	Elongation %*
COMMERCIALLY PURE TITANIUM				
MST Grade III	Sheet, Bar	70,000	50,000	25
(3 different strength levels)	Sheet, Bar	85,000	65,000	23
	Sheet, Bar	100,000	80,000	20
TITANIUM ALLOYS				
MST 6Al-4V				
Annealed	Bar	140,000	130,000	15
Age hardened (1)	Bar	165,000	155,000	12
Age hardened (2)	Bar	180,000	165,000	10
Annealed	Sheet	140,000	125,000	12
MST 3Al-5Cr	Bar	155,000	145,000	13

How to Use the Missile Market Guide and Directory

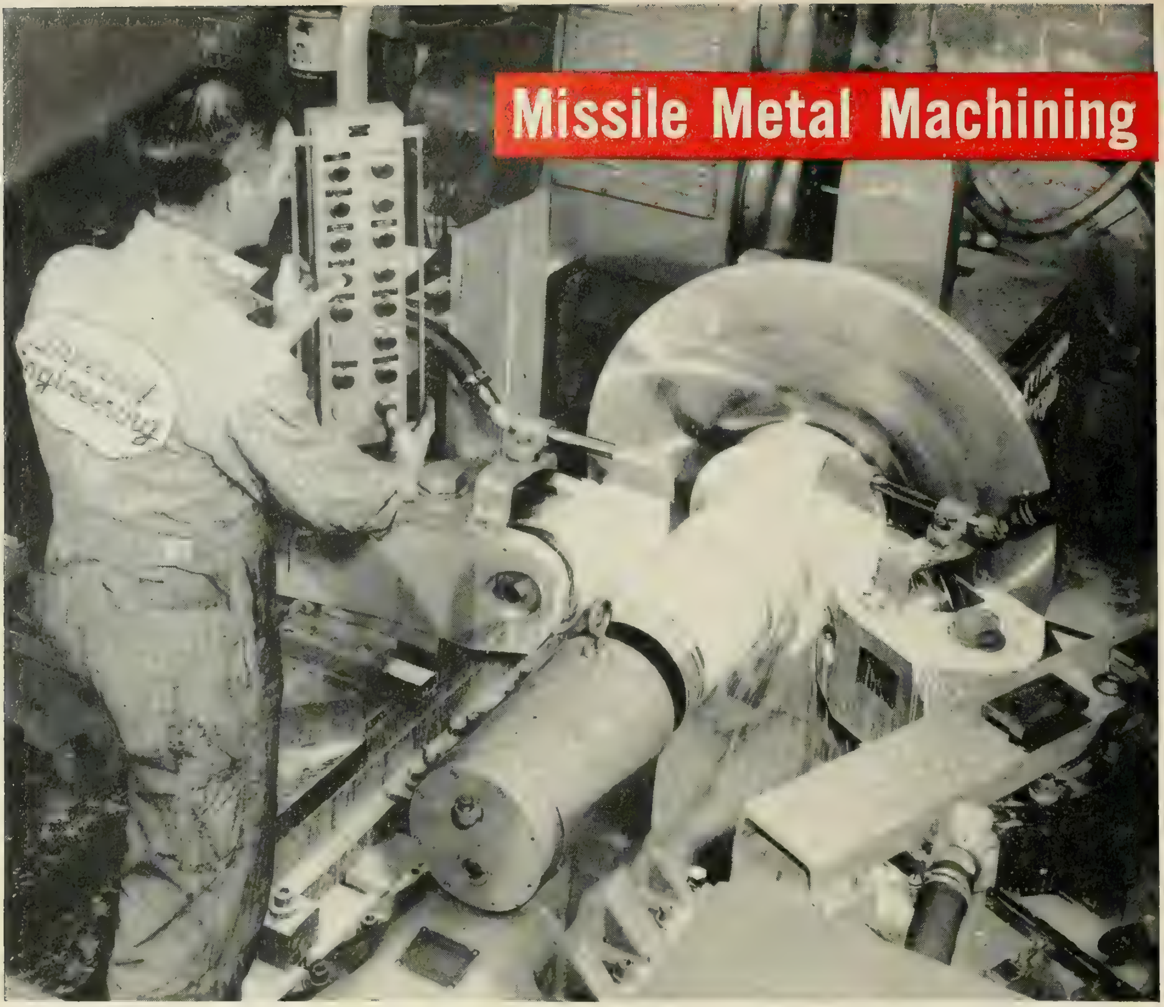
Products listed in the MISSILE CATALOG have been divided into nine major categories (listed above) for the convenience of the user. If you are interested in a particular item in one of these major headings, refer directly to the section desired. Products are listed alphabetically by section.

Certain products are listed under several major categories. You should refer to the PRODUCT CROSS INDEX (beginning on page 444) where you will find listed the page numbers of all products listed in the Directory.

To locate the company name, address, and key purchasing and sales personnel of a supplier, refer to the MISSILE PURCHASING DIRECTORY (page 33).

Type of company activity is explained by the coding at the end of each listing in the MISSILE PURCHASING DIRECTORY. Codings are explained at the bottom of every right hand page.

NOTE: Throughout the issue, advertisers are identified by **bold face** listings.



NEW HYDROSPINNING AT DIVERSEY

HERE you see a large solid propellant nozzle being hydrospun by a Diversey craftsman. Diversey has pioneered in the research and development of this remarkable cost saving technique. The missile nozzle above was one job that went through the research and study stages and now you see it in successful production.

At Diversey you have the LARGEST FACILITIES for your missile metal machining problems. Diversey again displays progressive leadership by their accumulated experience in this new art of hydrospinning. Diversey is available for study on your hydrospinning problems. Now you can bring your hydrospinning jobs to Diversey as well as your missile metal machining jobs.

This Is The Missile Business

A missile is only as good as an industry. Two years ago there was no such thing as the missile industry—or at least nobody recognized it as such. At that time, missiles were fascinating-to-frightening sidelines of the old, established aircraft industry. But it soon became apparent that these were an entirely different breed of bird.

While aircraft are manned, missiles are not. While aircraft are ribbed, skinned and riveted, missiles—more-often than not—are forged, machined, welded and heat-treated. While aircraft must be designed to live long and relatively stable lives, missiles live only a few very hectic moments. While aircraft make repeated flights, missiles only sit and wait.

That missiles and rockets are "different" is now an accepted fact. And even as they are different, so is the industry that produces them. Though this industry includes many companies from the aircraft industry, it also includes a great and growing number of other companies that had little, if anything, to do directly with aircraft. Estimates of the number of companies intimately concerned with rockets, missiles and space flight run to many thousands, depending on just where you draw the line. The number that want to get into the business runs even higher.

This is a burgeoning industry. Its rate of growth has been extremely rapid, but is nothing compared to what's in store. In less than a decade, the "missile market" has rocketed from practically nothing to over $3.5-billion today, prospects of $7-billion in another three years and some $20-billion or more by 1970—for military purposes alone. Who knows what the civil market may be?

This is the first industry in all history whose prospects embrace the infinite. This year rockets will be launched at the moon. Within five years instrumented probes will be fired at Mars and Venus. Within 18 months, man himself will travel in space—if only for short periods of time—in a rocket powered vehicle that can scarcely any longer be called an aircraft. Within 10 years, man will be patrolling the immediate environment of earth—out to, say, 40,000 miles—in operational military space craft.

Never have the mind of man and his technologies been called upon to produce so much of such importance in so short a time. Yet on performance under these rigorous requirements depends the future of free men everywhere. For, we are not alone in our strivings into space. The Union of Soviet Socialist Republics, already well advanced in the art of astronautics, suffers no illusions as to the economic, political and military potentials that lie beyond our ecosphere.

The race into space is a race for survival. How well we do depends more than ever on the industry that supplies the ideas and translates them into tools we can use. It has been said that rockets, missiles and space flight is an art struggling to become a science. And so it will be for some time—so long as requirements continue to fall within that range that constitutes the dim limits of human knowledge.

But money as well as brains are involved. The industry must not only conceive and manufacture the impossible, it must do it at a reasonable cost in dollars and industrial resources. This is not an easy task, but nobody with any experience at all has ever suggested that it was. It is, however, a job that must be done.

This is the Market Guide—another service by MISSILES & ROCKETS to its industry. In the following pages are over 76,000 company product listings. Over 3,000 companies are named.

Need an idea, a system, a component, a small part or an inspiration? Somewhere in these pages are the companies that can supply them. They are the vanguard of this growing industry. Their job: to deliver the goods—the right quality at the right time and the right price. Theirs is the responsibility for survival.

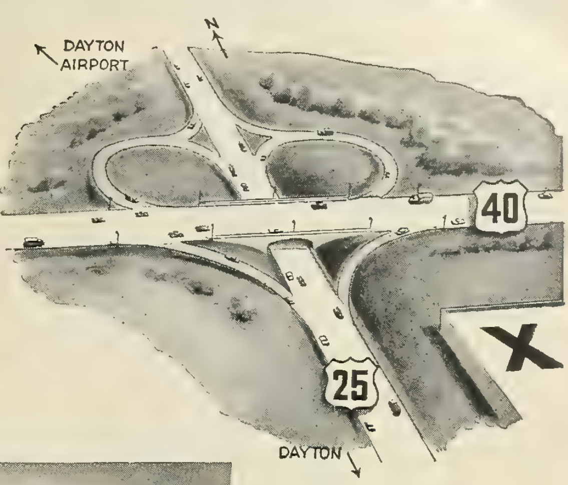
A NEW AIRCRAFT PRODUCTS PLANT...

THE LELAND ELECTRIC COMPANY
Division of
AMERICAN MACHINE & FOUNDRY COMPANY

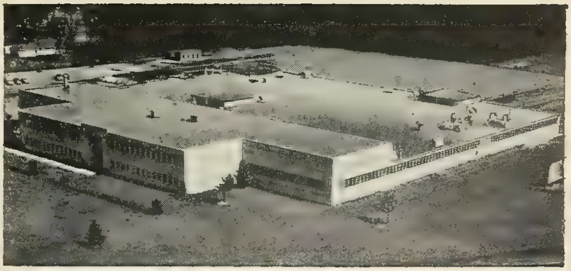
AT AMERICA'S AVIATION CROSSROADS



At Vandalia, Ohio, the Leland Electric Company has brought together under one roof, a complete research, development and production facility for aircraft electrical accessories.

Here highly trained personnel with widely diversified skills meet the thousands of complex problems that arise in the manufacture of precision aircraft products.

Within this air-conditioned plant's 140,000 square feet . . . a Model Shop with the most advanced equipment . . . a wide range of modern, highly accurate Environmental Testing facilities . . . a special "Short Order Shop" to smoothly absorb the low activity of an aircraft contract in its early production stage.



The increasing demand for Leland Aircraft Products "built" this plant. Tried and proven Leland products of today . . . and history-making Leland products as yet unknown . . . will be produced here. Today, tomorrow, why not meet *your* contract needs through Leland?

Before you cut tin—

call Shafer in

The earlier you count on Shafer Bearing performance in advanced designs, the surer you'll be of successful missile control systems at final count-down.

High temperatures...high loads...thermal shock...all these are familiar problems to missile designers and to Shafer engineers, for Shafer has pioneered in the research and development of high temperature control bearings for missiles of advanced design and proven capability.

The famous exclusive design features that have made Shafer first choice for the toughest bearing applications in the airframe industry—greater capacity for its envelope dimensions and weight...integral self-alignment with full capacity...greater resistance to shock loadings and vibrations—may provide the answer to your missile control system bearing problems.

So before you cut tin, be sure to call Shafer in.

Packed for action

by Lyon Missile-Pak

Processing and packing the missiles that must be delivered ready for instant use at the far-flung outposts of the United States defense system is one of the big jobs being handled by Lyon Aircraft Services at its 5-acre Burbank plant. Specifications for the crate shown here called for removing 3 sides and top within three minutes. Lyon engineers developed a crate that could be dismantled in 1 minute, 30 seconds! For civilian and military processing and crating, shipped domestic or foreign, consult Lyon Aircraft Services. A consultation may turn up unexpected economies.

CENTERLESS

PRECISION LAPPER

An accurate and simple finishing operation; for reducing oversize gages to correct size; for lapping worn plug gages to next lowest size; for lapping bearings, bushings, shafts, and any cylindrical part which requires close tolerance and fine finish. Eliminates ring lapping. Laps either straight or tapered plugs and pins with or without shoulders and handles a wide range of diameters. No special tooling is required. A simple adjustment to vary the space between the rolls permits lapping any diameter from .010—6″ with no time lost. Roll speeds may be adjusted.

U.S. AIR FORCE
RASCAL

Rascal JOINS SAC

The nation's first air-to-surface missile, the Bell GAM-63 Rascal, is now on operational status with the Strategic Air Command of the U. S. Air Force.

This rocket-powered guided missile can extend the penetration ability of SAC crews since it is launched and accurately directed on its mission while the bomber which carries it remains many miles away from the target area.

Bell Aircraft designed, developed and now produces the Rascal "Crewsaver" for the Air Force under a complete weapon systems responsibility. This responsibility includes the airframe, guidance, liquid fuel rocket power plant, ground support and launching equipment and techniques and training.

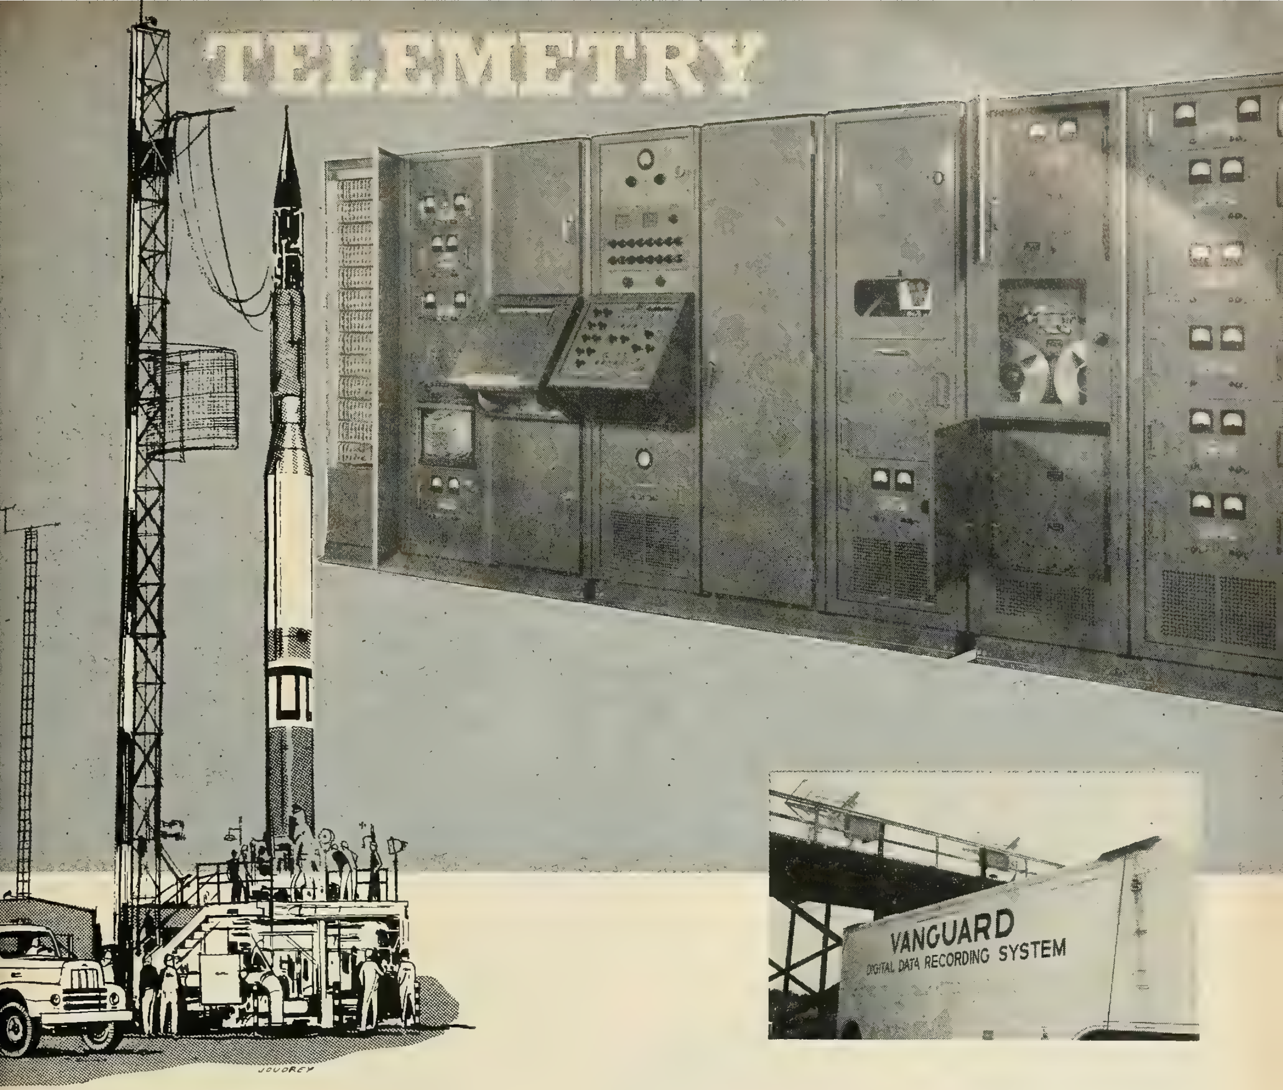
New FM/FM Subcarrier *DISCRIMINATOR* . . . with the exclusive design that incorporates provision for *full automatic compensation for wow and flutter*, with improved rejection of adjacent channels. This is the only discriminator ever designed specially for optimum data system performance, with greater linearity and stability, fewer operating controls, and greater ease of maintenance. Modular construction (with printed circuits) provides convenient plug-in tuning units for all standard IRIG telemetering channels, also plug-in power supply.

Output suitable for pen motors, galvanometers, or tape recording at any standard speed. Automatic limiter protects output device against voltage surges.



The Vital Link in Missile Progress

PERSONNEL INQUIRIES INVITED.

Missiles are test fired for only one purpose: to obtain data that will help build better missiles. If the test does not yield this information it must be considered unsuccessful — regardless of how well the "bird" performed.

Reliable telemetry equipment consequently assumes a vital role in the development of the missiles so necessary to our defense program. There is no other way to collect and preserve the all-important data from unmanned and unrecoverable test vehicles.

Radiation, Inc. is a pioneer in the design and development of advanced telemetering and data processing systems. A significant example of this work is the Vanguard ARRF (Automatic Recording and Reduction Facility) installation. This equipment provides Navy scientists with final reduced data on the performance of a Vanguard vehicle in less than 72 hours after a firing.

From tiny airborne transmitters to complete ground stations, we have the experience and facilities to solve your problems in telemetry and associated areas. Write today for our brochure describing this capability.

How to Do Business with the DEPARTMENT OF DEFENSE

Doing business with the Defense Department or its contractors has been of increasing importance with the development of new missile markets. How important this potential is can be illustrated best by a look at the Pentagon plans and programs and how they have grown.

In the year ending June 30, 1957, the Defense Department's obligational program for missiles of all types amounted to $4.47 billion including the cost of bringing missiles to operational status, plus the cost of procuring missiles for operational purposes. These figures included all procurement, construction, research and development funds directly associated with missile programs. Programmed obligations for fiscal 1958 total $5.06 billion including supplemental appropriations and, in fiscal 1959, current programmed obligations including recently submitted budget amendments are now estimated at $6.3 to $6.4 billion.

Actual expenditures for missiles out of major procurement and production funds totalled $2.095 billion in fiscal 1957. In fiscal 1958 expenditures are estimated at $3 billion and in fiscal 1959, Defense Department expects to spend at least $3.5 billion and perhaps more. The figures do not include funds charged to research and development accounts.

• **Analyze Sources**—There are many ways in which a small (500 employees or less) manufacturer can approach the problem of obtaining some of this vast amount of business. But unless he goes about it properly, he can waste an inordinate amount of time.

All services maintain offices throughout the country designed to help businessmen who offer their services to the government. Each one of these offices has a Production Division that includes an Industry Cooperation Officer.

The Industry Cooperation Officer is there to advise on all aspects of procurement. He maintains close liaison with prime contractors in his area and is often able to provide information of suitable local subcontract opportunities.

In addition, the U.S. Department of Commerce publishes what it calls "Synopsis of U.S. Government Proposed Procurement, Sales and Contract Awards" that provides information on prime contract opportunities as well as subcontract opportunities.

The "Synopsis" may be obtained at Department of Commerce field offices throughout the country or by subscription from the Department of Commerce, 433 West Van Buren St., Chicago, Ill.

Other federal agencies, such as the Small Business Administration, maintain regional offices in the principal industrial areas of the country. They attempt to keep current information on the activities of Defense contractors.

• **Analyze Facilities**—Before deciding which prime contractors should be approached, the subcontractor must carefully analyze his own shop to determine the items he might be able to produce. This seems elementary, but a surprising number of firms fail to do this before they set out on a hunt for government business.

Questions that should be answered include: Can you do rough or precise machining? Is your shop arranged for mass production or is it better suited to job-lot type of production? What other types of work could be done if you added a few additional pieces of equipment?

Having analyzed his facilities, there are 10 suggested steps a manufacturer should take in seeking an order from a prime contractor:

Investigate the advisability of combining your facilities with those of other concerns to increase or supplement your productive capacity.

Decide what you want to make. Prepare a statement or brochure about your company and its facilities, listing those items you prefer to make.

Recognize that you have a selling job to do that will require the same sort of sales effort you put into civilian operations.

Communicate with the appropriate sources for information on current subcontract opportunities in your area.

Seek out the prime contractor who appears to have the greatest need for your facilities and products.

Submit information on your facilities and experience to the prime contractor, preferably in a personal call, so that you can discuss specific details.

Allow a reasonable time to pass between your inquiry and a reply. If the prime contractor is in the early planning or production stages, he may not be immediately ready to enlist the services of subcontractors.

If you receive an order, learn how the prime contractor expects you to function. This includes such activities as tooling, submission of production samples, deliveries and engineering changes.

Prepare for termination of the military subcontract work by keeping up some civilian operations.

Businessmen, large and small, should study the legal problems carefully before entering into any contract with the government. It would be advisable, in fact, to retain an attorney with experience in this type of contractual agreement and obligation. ★

How to Do Business with the DEPARTMENT OF THE ARMY

UNITED STATES OF AMERICA WAR OFFICE
MDCCLXXVIII

* * *

Contractors who desire to participate in the U.S. Army Research & Development programs should follow two steps: (1) be sure that a complete presentation is prepared and, (2) submit it to the proper source.

There are four important steps to insure that a complete presentation is properly prepared and correctly submitted. The contractor should first *consider the proposal*—is it related to the Army's R&D activities? Next, he must *identify the proper source of communications*—which of the Army's R&D branches should receive this proposal to insure expeditious handling. Then, *prepare and forward the proposal*—what information and materials should be submitted? Final step is to *arrange a contract*—how are contract arrangements started?

Before he submits a proposal to the Army, the contractor should have a thorough understanding of the Army's research and development requirements. Research is the theoretical or experimental search for fundamental knowledge and control of a particular substance or physical phenomenon. When this search is conducted without any specific goal it is basic research. When it is concerned with a particular problem, it is applied research. The Army supports some basic research, but its greatest financial outlay is in the area of applied research.

Development is the practical application of investigative findings and theories of a scientific and technical nature. It includes the construction and testing of prototype models and devices.

Unless accompanied by an offer of personnel and facilities to undertake further research and development, ideas or inventions that might have military usefulness should *not* be sent to Army R&D. The purchasing or procurement of standard products or components is also beyond the scope of Army R&D activities. These two fields are handled by other agencies.

Inquiries requesting the identity of the proper agency should be directed to: Office of Chief, Research and Development, Department of the Army; Washington 25, D.C., Attn: Technical Liaison Office. This office maintains a list of items and activities with which each of the technical services and commands of the Army is concerned.

Contractors' proposals should be clear and complete and contain the following information in the first letter:

(A) Organizational information—(1) Name and type of company. (2) Total number of employees; also totals of research scientists, development engineers or other technical personnel. (3) Facilities—brief description of laboratory equipment and other facilities suitable for R&D activity (4) Clearance—if the contractor has "facility clearance" from the Army, Navy or Air Force, state which. (5) **Background**—brief outline of work done previously in field of the proposal. (6) Descriptive brochure and financial statement if available.

(B) A clear and full discussion of proposed work in terms of objective and scope.

Should the contractor have no specific project to propose, but merely wishes to list his company as a possible candidate for future work that may develop in his field, an expression of this desire along with the organizational information outlined above would be welcomed by the Office of the Chief of Research and Development.

Final procedure for the contractor is arranging a contract. Most Army R&D contracts result from negotiation rather than from advertising and bids. This is because the government is concerned essentially with buying the competence of individuals and organizations, managerial abilities, techniques and integrity. Contractors are selected on the basis of experience, adequacy of facilities, skill and availability of personnel, quality of workmanship, plant organization, etc., as well as price. The award of a contract is generally by administrative decision based on considered judgment.

If the contractor's proposal is accepted, a contract may be negotiated between his organization and the appropriate agency or subagency. Details regarding the type of contract, calculation of overhead or indirect costs, capital equipment to be furnished by the Army, special stipulation pertaining to contract termination, labor regulations, patent rights, etc., will be discussed and worked out between the contractor and the agency concerned.

If the proposal *is not* accepted, the government *is not* obligated in any way to reimburse the contractor for any costs which he may have incurred in submitting his proposal or attempting to arrange a contract.

Corps of Engineers: Chief of Engineers, Department of the Army, Washington 25, D.C. ATTN: Research and Development Division.

Ordnance Corps: Chief of Ordnance, Department of the Army, Washington 25, D.C. ATTN: Research and Development Division.

Quartermaster Corps: The Quartermaster General, Department of the Army, Washington 25, D.C. ATTN: Office of Research and Development.

Signal Corps: Chief Signal Officer, Department of the Army, Washington 25, D.C. ATTN: Research and Development Division.

Transportation Corps: Chief of Transportation, Department of the Army, Washington 25, D.C. ATTN: Executive for Research and Development.

Chemical Corps: Chief Chemical Officer, Department of the Army, Washington 25, D.C. ATTN: Research and Development Command.

Army Medical Service: The Surgeon General, Department of the Army, Washington 25, D.C. ATTN: Research and Development Division.

Army Ordnance Missile Command: Commanding General, U.S. Army Ordnance Missile Command, Redstone Arsenal, Ala.

Fields of interest:

Corps of Engineers: This Corps has a large part of the ground support equipment for the Army's family of rockets, missiles and satellites. This Corps has the following interests: construction and maintenance equipment, launching towers, bridging and stream crossing equipment, cover and concealment, electrical equipment (generator and convertors), fire-fighting equipment, industrial engines including turbines, industrial gases and compressors, infrared and night vision equipment, liquid fuels distribution (pipe lines), mapping, geodesy and surveying, materials, mine warfare, nuclear power and heating plants, prefabricated buildings, processing and packing, regional influences, snow, ice and frozen ground, special weapons effects and water supply and sanitation.

These R&D fields of interest for the Corps of Engineers are divided among the following: Director, Waterways Experiment Station, Vicksburg, Miss.; Director, Snow, Ice and Permafront Research Establishment, Wilmette, Illinois; District Engineer, Philadelphia District, Philadelphia, Pa.; Commanding General, Engineer Research and Development Laboratories, Fort Belvoir, Va.

Ordnance Corps: This Corps has the following interests: ammunition, artillery, combat vehicles, fire control material, fuels and lubricants, materials, motor transport for personnel and small arms.

These R&D fields of interest for the Ordnance Corps are divided among the following: Commanding General, Aberdeen Proving Ground, Md.; Commanding Officer, Diamond Ordnance Fuse Laboratories, Connecticut Ave. & Van Ness St., N.W., Washington 25, D.C.; Commanding General, Frankford Arsenal, Bridesburg Station, Philadelphia 37, Pa.; Commanding General, Ordnance Tank-Automotive Command, 1501 Beard Street, Detroit 9, Mich.; Commanding Officer, Picatinny Arsenal, Dover, N.J.; Commanding Officer, Watervliet Arsenal, Watervliet, N.Y.; Commanding Officer, Office of Ordnance Research, Box C. M. Duke Station, Durham, N.C.; Commanding General, Ordnance Weapons Command, Rock Island, Ill.; Commanding Officer, Rock Island Arsenal, Rock Island, Ill.; Commanding Officer, Springfield Armory, Springfield 1, Mass.; Commanding Officer, Watertown Arsenal, Watertown 72, Mass.

Quartermaster Corps: This Corps has the following interests: chemicals and plastics, dispensing and handling equipment, aerial delivery equipment, environmental protection, foods, cooking and radiation, individual clothing and equipment, mechanical equipment, test materials and techniques.

The R&D fields of interest for the Quartermaster Corps are the responsibility of the: Commanding General, The Quartermaster Research and Development Command, Natick, Mass.

Signal Corps: The Corps has the following interests: avionics, electronic countermeasures, electronic data-processing systems, ground photography, infrared ultraviolet, meteorological instrumentation, radar, radio and wire communication, radio direction finding, sound and light and television.

These R&D fields of interest for the Signal Corps are the responsibility of the: Chief, Laboratory Procurement Office, The Army Signal Supply Agency Watson Area, Fort Monmouth, N.J.

Transportation Corps: This Corps has the following interests: army aviation, helicopters and fixed wing, marine transport and operation, motor transport, rail transport, terminal operation and structural material for the above.

These R&D fields of interest for the Transportation Corps are the responsibility of the: Commanding Officer, Transportation R&D Command, Fort Eustis, Va.

Chemical Corps: This Corps has the following interests: biological agents, laboratory science, chemical agents, incendiaries, protective equipment, screening agents, smokes and weapons and munitions, chemical, biological, radiological.

These R&D fields of interest for the Chemical Corps are divided among the following: Commanding Officer, Army Chemical Center Procurement Agency, Army Chemical Center, Md.; Commanding Officer, Biological Warfare Laboratories, Fort Detrick, Frederick, Md.; Commanding Officer, Dugway Proving Ground, Dugway, Utah.

Army Medical Service: This Corps has the following interests: basic research in medical sciences, blood, blood derivatives and blood substitutes, dentistry, diseases of animals transmissible to man, internal medicine and equipment, neuropsychiatry and stress, preventive medicine and traumatic surgery, shock and burns.

These R&D fields of interest for the Army Medical Service are divided between the following: Chief, Research and Development Division, Office of the Surgeon General, Department of the Army, Main Navy Building, Washington 25, D.C.; Chairman, Armed Services Medical Material, Standardization Committee, 23rd and E Street, N.W., Washington 25, D.C.

U.S. Army Ordnance Missile Command: This Command has the following interests: drill ammunition for rocket launchers, ground equipment for guided missile systems, guided missile systems, less special weapons material, fuses for rocket and guided missiles, VT Jatos; except propellant, propellant for guided missiles, rockets, excluding warheads, rocket launchers, equipment and/or professional operations in support of: (1) engineering tests, (2) long range research on rockets and guided missiles, major weapons systems (*i.e.* Redstone-Jupiter, etc.) and Army's outer space projects (*i.e.* Explorer).

These R&D fields of interest for U.S. Army Ordnance Missile Command are divided among the following: Commanding General, Army Ballistic Missile Agency, Redstone Arsenal, Ala.; Commanding General, Army Rocket & Guided Missile Agency, Redstone Arsenal, Ala.; Commanding General, White Sands Proving Grounds, Las Cruces, N.M.; Jet Propulsion Laboratories, California Institute of Technology, 4800 Oak Grove Drive, Pasadena 3, Calif.

If in doubt as to which one of the above to write, then direct your query to: Commanding General, U.S. Army Ordnance Missile Command, Redstone Arsenal, Ala.

As mentioned earlier, some aspects of personnel and training R&D are accomplished by the Technical Services and some by other agencies. Thus for research in areas of personnel selection, classification, utilization and assignment write to: The Adjutant General, Department of the Army, Washington 25, D.C.

For research in the areas of personnel training, motivation and leadership write to: Human Resources Research Office, 2013 G Street, N.W., Washington 7, D.C.

For inquiries regarding all other Army research activities in the personnel field write to: Chief, Research & Development, Department of the Army, Washington 25, D.C. ATTN: Director of Research.

Over the period of the last few years, the would-be suppliers to the missile market have had one simple but important complaint—there's no single missile program and therefore no way to hunt down the contracts and bid specifications they need to get in the business.

For the U.S. Army this complaint has been rectified in that the U.S. Army Ordnance Missile Command has been established—give it time to adjust.

THE DEPARTMENT OF THE ARMY

Companies interested in the Department of the Army Guided Missile Program as a prime or subcontractor may utilize U.S. Army Ordnance Corps District Offices as readily accessible points of contact, or to discuss current procurements on a prime contract basis and possible potential subcontracting sources:

Birmingham Ordnance District
2120 North Seventh Avenue
Birmingham, Alabama

Boston Ordnance District
Boston Army Base
Boston 10, Massachusetts

Chicago Ordnance District
209 West Jackson Boulevard
Chicago 6, Illinois

Cincinnati Ordnance District
Swift Building
230 E. Ninth Street
Cincinnati 2, Ohio

Cleveland Ordnance District
Lincoln Building
1367 E. Sixth Street
Cleveland 14, Ohio

Detroit Ordnance District
574 East Woodbridge
Detroit 31, Michigan

Los Angeles Ordnance District
55 South Grand Avenue
Pasadena, California

New York Ordnance District
180 Varick Street
New York 14, New York

Philadelphia Ordnance District
128 North Broad Street
Philadelphia 2, Pennsylvania

Pittsburgh Ordnance District
200—4th Avenue
Pittsburgh 22, Pennsylvania

Rochester Ordnance District
Sibley Tower Building
25 North Street
Rochester, New York

St. Louis Ordnance District
1016 Olive Street
St. Louis 1, Missouri

San Francisco Ordnance District
1515 Clay Street, P.O. Box 1829
Oakland 12, California

Springfield Ordnance District
Springfield Armory
Springfield 1, Massachusetts

How to Do Business with

by Elizabeth Oswald

★ ☆ ★ ☆ ★ ☆ ★ ☆ ★ ☆

The Weapon System Concept is the key to Air Force procurement of guided missiles. This concept calls, generally, for centralization of responsibility in a single contractor for development and ultimately for production of a missile or aircraft. It is known as the industry-AF team approach.

This means that for the most part the weapon system manager is a big company with the resources in both facilities and skills to take on the job. Air Force policy has been to give weapon system responsibility to aircraft companies with which it has done business over the years.

The weapon system contractor under this scheme usually has the responsibility for determining, with AF approval, the subsystem contractors. These, too, are more often than not big companies with proven associations with the AF.

However, AF usually tells the weapon system contractor what part of the project must be subcontracted and inevitably substantial percentages of these subcontracts go to smaller, specialized companies. In this area, AF advises smaller companies to go directly to the weapon system contractor and to do a selling job.

• **Management responsibility** for AF is in a Weapon System Project Office which can help. In the earliest stages of the program, the WSPO is staffed by representatives of the Air Research and Development Command, which has principal responsibility. However, Air Materiel Command will ultimately take over this responsibility when procurement for inventory starts.

Headquarters of ARDC is at Andrews Air Force Base, near Washington, D.C. Ideas and inventions which may have application to Air Force missiles may be submitted for evaluation to the Office of Technical and Industrial Relations of ARDC.

Two other concepts are used by the Air Force for the handling of the development and production of missiles. The first is the special case of the long range ballistic missiles where the AF itself has been the weapon system contractor through its Ballistic Missile Division at Inglewood, Calif. In this case, to provide technical know-how normally supplied by the weapon system contractor, AF employed Ramo-Wooldridge Corp. to supervise the technical aspects of the program.

• **Second concept** is that of "associated contractors." Here there is no weapon system manager as such, but one contractor would be responsible for the missile frame, a second for electronics and perhaps a third for propulsion or ground launching equipment.

AF is now experimenting with still another method of doing business—this is a contractor team approach on the theory that no one company might be capable of providing management and resources needed in the way of both skills and facilities. At least two new projects are being handled in this manner—both dealing with electronic countermeasures. And it is a virtual certainty that the biggest project of them all, the so-called "Dynasoar" boost-glide aircraft designed to put men into space would be developed on this basis, with a special AF agency created to handle AF management responsibilities.

This last concept is considered a potential source of more AF dollars for "smaller" rather than small companies, who could not take on the highly complex program alone. As a result, ARDC is watching current experiments with interest, the big question being whether a group of companies can be so welded together to get the job done.

Not only does weapon system concept dominate AF buying in the missile field but it also plays an important role in the so-called support area—where AF has set up within its own shop a series of support managers.

These support managers are responsible for determination of requirements for spares, both those which are furnished by contractors and those furnished by the government for which contracts will be made. Support manager for the Falcon missile and for the Sidewinder is Middletown (Pa.) Air Materiel Area; for the Rascal and the Green Quail, it's Oklahoma City Air Materiel Area; Bomarc support is from Ogden Air Materiel Area at Ogden, Utah, as is the support for Snark and Bull Goose.

Support managers for the various versions of the Matador and for its latest version, Mace, are at Wright Air Materiel Area. The support manager for Thor, Atlas and Titan is at Mira Loma AF Station, San Bernadino, Calif.

Over the years, it is expected that support managers will buy bits and pieces required for the maintenance of missiles from local sources as well as from original sources of supply.

• **Small business specialists** have been assigned by the Air Force to some 18 Air Procurement District Offices. Companies who want to participate or want to obtain procurement information should contact these offices.

As a reminder, however, Air Force officials explain that construction of missile bases which include in some cases equipment are handled for the most part in the United States by the Army Corps of Engineers as AF agent.

The AF procurement district offices are located at Boston Army Base, Boston, Mass.; 218 Market Street, Newark, N.J.; 111 E. 16th Street, N.Y. 3, N.Y.; 1411 Walnut Street, Philadelphia, Pa.; 912 S. Ervay, Dallas 1, Tex.; 1279 W. Third Street, Cleveland 13, Ohio; W. Warren Avenue & Lonyo Blvd., Detroit 32, Mich.; 54 Monument Circle, Indianapolis 6, Ind.; 20 Symington Place, Rochester 3, N.Y.; 5555 S. Archer Avenue, Chicago 38, Ill.; 770 N. Plankinton Ave., Milwaukee, Wis.; 1114 Market St., St. Louis, Mo.; Building 70, Area "C", Wright Patterson AFB, Dayton, Ohio; P.O. Box 5555, Helen St. Annex, Tucson, Ariz.; 1206 Maple Avenue, Los Angeles, Calif.; 41 Exchange Place S.E., Atlanta, Ga.; and Building 1, Oakland Army Terminal, W. Grand Ave. & Maritime, Oakland 14, Calif.

the AIR FORCE

★ ☆ ★ ☆ ★ ☆

Companies now holding prime weapon system contracts with the AF include: Boeing Aircraft Corp., Seattle, Wash.; Convair Div. of General Dynamics Corp., San Diego, Calif.; Douglas Aircraft Corp., Santa Monica, Calif.; Lockheed Aircraft Corp., 2555 North Hollywood Way, Burbank, Calif.; Martin Company, Baltimore, Md., and Denver, Colo.; North American Aviation Inc., Los Angeles, Calif.; Northrop Aircraft Corp., Hawthorne, Calif.; McDonnell Aircraft, St. Louis, Mo.; and Fairchild Engine and Aircraft Corp., Hagerstown, Md.

As matters now stand, the largest part of the Air Force's missile program is controlled by the Air Research & Development Command at Andrews AFB, Md.

- **Office of Scientific Research,** located in Washington, D.C., is responsible for conducting an "exploratory research program." It is divided into seven directorates, each of which are divided themselves into divisions.

These are: Directorate of Aeronautical Sciences, which includes three divisions—mathematics, mechanics and combustion dynamics.

Directorate of Physical Sciences, which includes two divisions—physics and nuclear physics.

Directorate of Research Information, which includes three divisions—technical information and intelligence, presentations, and liaison and analysis.

Directorate of Advanced Studies with two divisions—systems, which deals with atmospheric and extra-atmospheric flight and advanced propulsion systems and, techniques which deals with detection and identification and novel control techniques.

Directorate of Bio-Sciences, with two divisions—aeromedical and behavioral sciences.

Directorate of Material Sciences, with two divisions—chemical and solid state.

ARDC maintains a number of research centers for special programs. These include:

Cambridge Research Center, Bedford, Mass., which carries a broad program of research, development and testing in electronics, geophysical sciences and human engineering.

Wright Air Development Center, Dayton, Ohio. The WADC program includes work in the technical fields of materials, aerodynamics, human engineering, propulsion, flight control, aeronautical equipment, ground support equipment and the airborne parts of reconnaissance, electronic countermeasures, weapons guidance, electronics techniques, communications and navigation.

Air Force Missile Development Center, Patrick AFB, Florida. In addition to its well advertised tests of long range guided and ballistic missiles and target drones, the Center does research and development on test procedures.

Arnold Engineering Development Center, Tullahoma, Tenn., operated by Aro, Inc. The center plans, constructs and operates a series of wind tunnels and high altitude test cells for the test and evaluation of aircraft, guided missiles and air-breathing propulsion systems. The Center, a service organization, does testing for all services and for their industrial contractors.

Special Weapons Center, Kirtland AFB, N.M. Work here is centered on the AF's responsibilities in the development and testing of nuclear and thermonuclear weapons, their components and associated equipment. It also provides backup for AEC in conducting special weapons tests.

AF Missile Development Center, Holloman AFB, N.M. It is assigned research and development of specified guided missile subsystems and components and in biodynamics and space biology. It also supports AF research programs in guided missiles, electronics, geophysics, physiology, biophysics and psychology.

Rome Air Development Center, Griffis AFB, N.Y. The Center develops, tests and provides technical support for ground electronic systems and equipment. These include ground radar, navigation aids, communications, electronic countermeasures and other specialized development. It also places most of the contracts for procurement of electronic support equipment.

AF Personnel and Training Research Center, Lackland AFB, Tex. makes predictions of the personnel requirements which will result from the development of new weapons systems.

In addition to the major centers described, ARDC includes: The Office of Aircraft Nuclear Propulsion; the Armed Services Technical Information Agency, with field offices in Los Angeles, San Francisco, New York, Washington, D.C. and Dayton, Ohio. It also supports a European Office at Brussels, Belgium whose job it is to encourage European scientists to take in research contracts, and to monitor such contracts.

Finally there is the AF Ballistic Missile Division, Inglewood, Calif., which is responsible for managing the AF Thor, Atlas and Titan at this time and the second generation of missiles to follow. Research interest runs from fundamental research to crash hardware programs where bugs are found and the need for an answer is immediate.

Moving out of the research area, and into the "buy program" for inventory, the Directorate of Procurement and Production at the Air Materiel Command, Wright-Patterson AFB, Dayton, Ohio, takes charge. The function of the directorate is to procure, produce, plan, schedule, budget and supervise aerial weapons including missiles, engines, armament and equipment down to the nuts and bolts which hold missile components and aircraft together.

The Directorate buys complete aircraft, missiles, engines, navigational and communications equipment and items which still require extensive engineering work. Under a new theory of decentralization, air materiel areas buy items in their assigned property classes corresponding to the classes for which they have primary supply and maintenance responsibility.

How to Do Business with the DEPARTMENT OF THE NAVY

by **Bernard D. Brown**

★ ☆ ★ ☆ ★ ☆ ★ ☆ ★ ☆

Large and small manufacturers who do business with the Navy, deal principally with three bureaus: the Bureau of Ordnance, the Bureau of Aeronautics and the Office of Naval Research. All three have their headquarters at 18th Street and Constitution Avenue, Washington, D.C.

"The Department of the Navy," said Raymond H. Fogler, former Assistant Secretary of the Navy for Materiel, "has continuously pursued a policy of encouraging maximum subcontracting to small firms by prime contractors. This policy has been repeatedly stressed in official contacts with Navy suppliers and is specifically set forth in all fixed-priced and cost-reimbursement-type contracts for supplies and services in excess of $5000."

During the six-year period beginning in fiscal 1950, small business firms received, through prime contracts, more than $6.7 billion. That figure represented 20.4 percent of the Navy's total direct purchases. Another 20 percent of the Navy's procurement dollars was channeled to small firms through subcontracts placed by Navy prime contractors.

(For a list of prime contractors who are doing or have done business with the Navy, a booklet, *Selling to Navy Prime Contractors* (NAVEXOS P-1030), is available from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C.)

OFFICE OF NAVAL RESEARCH

. . . the directing agency

The Office of Naval Research was established by Congress August 1, 1946, to coordinate scientific research in the Navy.

ONR's activities and responsibilities have steadily increased during the past 11 years, but it is still concerned, primarily, with basic research, rather than applied research.

The Navy's research and development interests are broad, covering nearly the entire spectrum of the sciences and touching almost every industrial field. ONR's basic policy is to provide the means for interbureau and interlaboratory groups to get together.

ONR moves into technical areas that appear critical to the Navy and into warfare areas when the work appears to require integration. It conducts most of the Navy's program of basic research. Most of this basic research is conducted in colleges and universities, although some research is also conducted in commercial and industrial laboratories and in nonprofit laboratories and institutions.

ONR does not conduct all of the Navy's research, however, nor does it conduct much development. Each Navy bureau is responsible for developing items for which it has special technical competence. In addition, the bureaus conduct their own programs of research in direct support of their own developments or their own technical areas.

Occasionally ONR conducts what is called exploratory development: research contractors work on a development until the principle is proved. The project is then turned over to the appropriate bureau.

For example, ONR's Air Branch directs a program which develops and demonstrates fundamentally new concepts in the field of aeronautics, such as the very light one-man helicopter. Later, the concept is fully developed by the Bureau of Aeronautics.

ONR branch offices throughout the country receive contract proposals, but all are finally negotiated in Washington. Branch offices are located in New York, Boston, Chicago, San Francisco, Pasadena and London.

Serving under each branch office are resident representatives at various colleges and universities, including Rochester, Pennsylvania, Pittsburgh, Michigan, Ohio State, Kansas, Texas, Minnesota, Purdue, Washington, California, Stanford, Johns Hopkins and the Georgia Institute of Technology.

ONR also has field stations such as the Naval Research Laboratory in Washington; the Special Devices Center at Sands Point, Port Washington, N.Y.; the Underwater Sound Reference Laboratory at Orlando, Fla., and the Naval Biological Laboratory at Oakland, Calif.

In addition, any qualified person, educational institution, nonprofit organization or business firm may submit a research proposal to one of ONR's seven science divisions: Earth Sciences, Material Sciences, Physical Sciences, Mathematical Sciences, Biological Sciences, Psychological Sciences and Naval Sciences.

Each of these divisions is divided into branches. For example, the Physical Sciences Division has a Physics Branch, a Nuclear Physics Branch and an Electronics Branch. An electronics engineer or scientist who has a research proposal to make would be well advised to talk it over with the director of the Physical Sciences Division or the Electronics Branch. He may find that research is already underway on a similar proposal, or that his proposal is unique, has merit, will be seriously considered and a contract for its performance issued.

What applies to the individual also applies to representatives of organizations, whether profit or nonprofit, who wish to do business with the Office of Naval Research.

BUREAU OF ORDNANCE

. . . *armament developer*

The Bureau of Ordnance is responsible for the design, development, research, operating standards, manufacture, procurement, maintenance, distribution, repairs and disposition of all arms and armament employed by the Navy.

That includes, in addition to guns, armor, torpedoes, mines, depth charges, pyrotechnics and bombs, rockets and certain guided missiles and special weapons, ammunition, war explosives and chemicals. It also includes defensive nets, booms and buoys, anchors, moorings, propellants and appliances for these items and, except as specifically assigned elsewhere, optical and other devices and material for the control of guns, torpedoes and bombs.

BuOrd also has responsibility for maintenance, control, upkeep and operation of naval ordnance activities (depots and the like) which house these armaments.

Just how important is BuOrd in the total Navy missile picture? Of the five Navy guided missiles now operational, four were developed under the direction of the Bureau of Ordnance.

BUREAU OF AERONAUTICS

. . . *develops aircraft & missiles*

The Bureau of Aeronautics is responsible for the design, development, procurement, production, test, fitting out, maintenance, alteration, repair and material effectiveness of Navy and Marine Corps aircraft, target drones, certain guided missiles, including components and equipment. It is also responsible for research and other pertinent functions related to these activities.

In addition, BuAer contracts for naval aircraft and technical or specialized aviation equipment and, most important, provides plant facilities and schedules for the production of these items.

BuAer also collaborates with the Bureau of Yards and Docks in design, construction and alteration of all aeronautic shore establishments.

The Bureau outfits and replenishes with aeronautical equipment and material all bases afloat and ashore from which naval aircraft operate, and supervises the service, repair, overhaul and salvage of naval aircraft and aviation equipment.

Procurement Items Listed by Responsible Office

NAVY PROCUREMENT OFFICES

BUREAU OF AERONAUTICS, Dept. of Navy, Washington 25, D. C.
Procurement Items: Propellers; aircraft launching equip.; electric aircraft actuators; electric cabin and cockpit heaters; tow target releases; barrier materials; catapults; aircraft loading ramps; energizers; radio communications equipment; beacons; beams; control tower equipment; direction finder groups; airborne radio navigation and air traffic control equip.; oscillators; airborne radios and equip.; ground radios and equip.; airborne navigation instrument transmitters; intercommunication equip.; radar equip.; airborne detection sets; altimeters; amplifiers; computers; direction, distance, elevation and range indicators; misc. meters; modulators; sonar; radiac equipment; infrared; switches; headsets; microphones, speakers; electric motors; electric control equip.; electric generators and generator sets; aircraft fuel systems components, booster coils, distributors, engine generators, ignition harness assemblies, magnetoes, manifold assemblies, engine starters, engine pumps, engine coolant radiators, engine filters, turbosuperchargers, engine control quadrants; fire trucks, hose, reels, trailers; aircraft sextants; aircraft compasses; accelerometers; altimeter indicators; controls, gyros, asemblies, regulators, valves and servos; gages and gage assemblies; indicators; fuel flow transmitters; misc. aircraft meters; oscillographs; oscilloscopes; weather balloons; indicators, computers, recorders; aviation seaplane and barrier deck lighting fixtures; ladders; aircraft test stands; engine test cell equipment; shop equipment; aircraft training aids.

BUREAU OF ORDNANCE, Dept. of Navy, Washington 25, D. C.
Procurement Items: Electron tubes; transmitters; rectifying crystals; dry cell batteries.

BUREAU OF SHIPS, Dept, of Navy, Washington 25, D. C.
Procurement Items: Unmounted antifriction bearings; plain unmounted bearings; books and pamphlets; telephone, telegraph, teletype, facsimile, radio communications, intercommunication equip.; sound recording and reproduction equip.; radar equip.; sonar; radiac equipment; infrared; electron tubes, transistors and rectifying equip.; antennae, wave guides and related equip.; electric motors; electric control equipment; dry cell batteries; electric wire and cable; misc. power equip.

Purchasing Locations and Chief Officers

Chief, Bureau of Aeronautics, Washington 25, D.C.
Chief, Bureau of Ordnance, Washington 25, D.C.
Chief, Bureau of Ships, Washington 25, D.C.
Chief, Bureau of Yards and Docks, Washington 25, D.C.
The Quartermaster General, Headquarters, U.S. Marine Corps, Washington 25, D. C.
Officer in Charge, Navy Purchasing Office, Main Navy Building, 17th Street and Constitution Avenue, Washington 25, D.C.
Officer in Charge, Navy Purchasing Office, 111 East 16th Street, New York, N.Y.
General Stores Supply Officer, General Stores Supply Office, 700 Robbins Avenue, Philadelphia 11, Pa.
Electronics Supply Officer, Electronic Supply Office, Great Lakes, Ill.
Aviation Supply Officer, Aviation Supply Office, 700 Robbins Avenue, Philadelphia 11, Pa.
Officer in Charge, Ship Parts Control Center, Naval Supply Depot, Mechanicsburg, Pa.
Yards and Docks Supply Officer, Yards and Docks Supply Office, Naval Construction Center, Port Hueneme, Calif.
Submarine Supply Officer, Submarine Supply Office, Rittenhouse Square Building, 19th and Walnut Streets, Philadelphia 3, Pa.
Commander, Naval Shipyard, Building 153, Portsmouth, N.H.
Supply Officer, Naval Gun Factory, Building 176, M Street at 8th Street Southeast, Washington 25, D.C.
Fuel Supply Officer, Fuel Supply Office, Naval Gun Factory, Washington 25, D.C.
Ordnance Supply Officer, Naval Ordnance Supply Office, Mechanicsburg, Pa.
Chief of Naval Research, Washington 25, D.C.
Director, Special Devices Center, Office of Naval Research, Sands Point, Port Washington, Long Island, N.Y.
Commander, Military Sea Transportation Service, Washington 25, D.C.
Office in Charge, Navy Ships Store Office, 29th Street and 3rd Avenue, Brooklyn 32, N.Y.

Activities listed below purchase general-use items as well as items of a technical nature to fulfill their own special requirements or those of other naval activities in their geographical area for which they purchase.

Navy Purchasing Offices, Los Angeles, Calif.; San Francisco, Calif.; Norfolk, Va.
Naval Supply Depots, Newport, R.I.; Great Lakes, Ill.; Seattle, Wash.
Naval Shipyards, Boston, Mass.; Philadelphia, Pa.; Charleston, S.C.; Bremerton, Wash.
Naval Air Stations, Patuxent River, Md.; Jacksonville, Fla.; Pensacola, Fla.; Memphis, Tenn.; Corpus Christi, Tex.; Dallas, Tex.
Marine Corps Air Station, Miami, Fla.
Naval Ordnance Plants, Indianapolis, Ind.; Forest Park, Ill.; York, Pa.; Macon, Ga.
Naval Ammunition Depots, Crane, Ind.; McAlester, Okla.
Naval Stations, New Orleans, La.; Orange, Tex.
Naval Academy, Annapolis, Md.
Naval Submarine Base, New London, Conn.; Naval Air Material Center, Naval Base, Philadelphia, Pa.; Naval Proving Grounds, Dahlgren, Va.; Navy Mine Countermeasures Station, Panama, City, Fla.; Naval Research Laboratory, Anacostia, Washington 25, D.C.; Navy Hydrographic Office, Suitland, Md.; Naval Ordnance Laboratory, White Oak, Md.; Naval Powder Factory, Indianhead, Md.
Marine Corps Depot of Supplies, Philadelphia, Pa.; San Francisco, Calif.

- 1/4 the size of standard designs
- 1/2 the weight of standard designs
- Direct Current or 400 Cycle
- Aircraft & Missile Applications
- Wide range of timing programs
- Timers have 1 x 2 inch cross section.
- Indicators only 1 1/4 inch diameter.

Miniature Motors and
Custom Devices
also available.

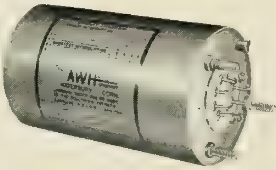
TIME-PROVEN STANDARDS OR TEST-PROVEN SUB-MINIATURES . . . ALL DESIGNED FOR RELIABLE OPERATION IN YOUR APPLICATION

TIMING AND CONTROL DEVICES BY THE A. W. HAYDON COMPANY ARE RECOGNIZED AS THE MOST DEPENDABLE PERFORMERS IN THE FIELD.

400 CYCLE MOTORS

Reversible — Light weight (8 ounces). 115 volts ± 10%; 55 milliamps. Torque: 0.025 oz-in at 3000 rpm. Meet Military Requirements. Write for Bulletin AWH MO 803.

MINIATURE HERMETICALLY SEALED TIMERS



Supplied in 2½" diameter housing. Optional mounting and electrical termination.

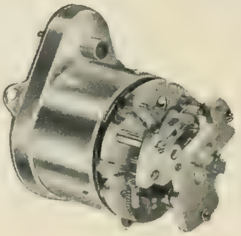
TIME DELAY RELAYS
Single or multiple switching. Delay periods from 2 seconds to 3 hours. Write for Bulletin AWH TD 400.

REPEAT CYCLE TIMERS
Single or multiple switching. Wide Range of Time Cycles. Write for Bulletin AWH RC 200.

PROPORTIONAL DELAYED RESET TIME DELAY RELAY

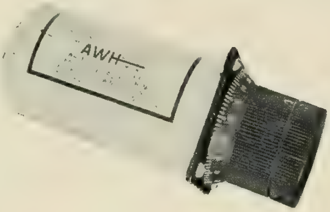
Provides a controlled reset rate. Designed to meet special applications. Hermetically sealed or enclosed in dust cover. Meets military requirements. Write for Bulletin AWH TD 402.

GOVERNED DC MOTORS



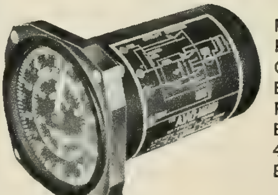
The A. W. Haydon Company now offers 3 series of Chronometrically Governed DC Motors. Each designed to do the same job in a different application.
5700 Series — non-military applications where extreme temperature, vibration and shock are not experienced.
5600 Series — Aircraft and military applications where extreme temperature and moderate vibration and shock are encountered.
5800 Series — Aircraft and missile applications where extreme temperature, vibration, and shock are encountered.
Write for Bulletin AWH MO 800, -801, -802, -804.

SPECIAL TIME DELAY RELAY



Supplied in 2.2" diameter housing. Precision unit: ± 1% accuracy. Meets military requirements. Adjustable over wide range. Write for Bulletin AWH TD 500.

STOP CLOCKS



Precision Movement — Electrical Reset. Temperature Range −55° C. to 85°C. Option on Mounting, Electrical Termination, Calibration Range. 20-30 Volt D.C. Write for Bulletin AWH-ET-700. 115 Volt, 400 CPS. Write for Bulletin AWH-ET-701.

OTHER BULLETINS AVAILABLE ON REQUEST
(or write for complete catalog).

AWH-MS-101-102	Application Data Sheets
AWH-RC-201	Basic Repeat Cycle Timers
AWH-RC-300	Precision Interval Timers
AWH-TD-401	Hermetic Adjustable Time Delay Relays
AWH-TD-403	Basic Time Delay Relays
AWH-TD-404-405	Dial Adjustable Time Delay Relays
AWH-TD-406	Basic Hermetic Time Delay Relays
AWH-ET-600-601	Elapsed Time Indicators
AWH-MO-805	Basic Direct Current Timing Motors

Many other specials also available, such as Electronic Time Delay Relays, Intervalometers, Reversible 60 CPS Motors.

Custom Design and Manufacture of Electro-Mechanical Timing Devices

Navy (Cont'd)

diving and salvage apparatus; generator and generator sets; hull type coolers; extinguishers, axes, rakes, brooms; azimuths, extants and octants; other meters; lubrication and fuel dispensing equip.; winches.

BUREAU OF YARDS AND DOCKS, Dept. of Navy, Washington 25, D. C.
Procurement Items: Cranes, derricks, hoists.

OFFICER IN CHARGE, NAVY PURCHASING OFFICE, Main Navy Bldg., 17th and Constitution Ave., Washington 25, D. C.

Procurement Items: Floor sanders, polishers and vacuum cleaners; electric motors; generators and generators sets; files, rasps, saws, blades and frames, edge tools, mechanical measuring tools; chests, kits and sets of a variety of types of tools; industrial cutlery; fastening devices; industrial X-ray machines; portable conveyor units; trucks, trailers, tractors, stackers and accessories; push carts, handcarts, wheelbarrows; industrial batteries; pallets and pallet trucks; calipers, tapes, squares, straight edges, vernier, gages, levels, pumb rules, protractors; metal rules, scales; sets, kits and outfits of measuring tools; bending and forming machines; power-driven presses; punches and shearing machines; forging machines and hammers; wire and metal ribbon forming machines; drawing machines; metal finishing equip.

AVIATION SUPPLY OFFICER, Naval Aviation Supply Office, 700 Robbins Ave., Philadelphia 11, Pa.
Procurement Items: Propellers; propeller hub barrels, aircraft rotor blades, rotor hubs, spinners, propeller synchronizers; landing shock struts; aircraft wheel and brake systems, landing floats, landing skis, auxiliary fuel tanks, hydraulic accumulators, lifting bags, actuating cylinders; hydraulic pumps, aircraft pressurizing and breathing equip.; cargo and personnel parachutes; parachute canopies; aerial delivery containers; aerial delivery slings; aircraft cargo tiedown equipment; safety belts and shoulder harnesses; cabin and cockpit heaters; tow target releases; aircraft windshield wipers; deceleration parachutes; tow bars; fin tilt jacks; landing gear lock assemblies; books and pamphlets; radio communication equip.; sound and recording equip.; radar equip.; headsets, microphones and speakers; electric hardware and supplies; electric motors; electric control equipment; electric generator and generator sets; dry cell batteries; electric wire and cable; power-driven presses; punches and shearing machines; forging machines and hammers; wire and metal ribbon forming machines; drawing mechines; metal finishing equipment; aircraft air-conditioning equip.; tires and tubes.

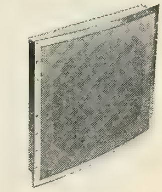
SUPPLY OFFICER, NAVAL GUN FACTORY, Building 176, M Street at 8th S.E., Washington 25, D. C.
Procurement Items: Electric generators and generator sets.

U.S. MARINE CORPS

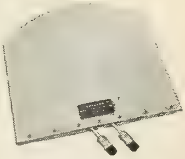
QUARTERMASTER GENERAL, Headquarters, U.S. Marine Corps, Washington 25, D. C.
Procurement Items: Unmounted antifriction bearings; unmounted plain bearings; books and pamphlets; acetylene; carbon dioxide; floor sanders, polishers, vacuum cleaners; brooms, brushes, mops and sponges; cleaning and polishing compounds; circuit breakers; switches; electric connectors; lugs, terminals and terminal strips; coils and transformers; electronic tubes, transformers and rectifying crystals; antennae, waveguides and related equipment; relays, contractors and solenoids; electric motors; electric control equip.; dry cell batteries; electric wire and cable; extinguishers, axes, rakes, brooms; bolts, studs, screws; nuts and washers; nails, keys and pins; discs, wheels, stones, abrasives; lubrication and fuel dispensing equip.; pushcarts and wheelbarrows; bending and forming machines; power-driven presses; punches and shearing machines; forging machines and hammers; wire and metal ribbon forming machines; drawing machines; metal finishing equip.; welding, flame cutting and metalizing equip.

AIR - AIR
AIR - GROUND - AIR
Airborne antennas that strengthen the communication chain . . .

. . . Antennas for aircraft and missiles . . . antennas for supersonic speeds . . . antennas for probing space . . . over 100 different types of antennas have been pioneered by DORNE & MARGOLIN. In the DORNE & MARGOLIN catalog you will find complete series of antennas with varying characteristics — one of which may fit your needs exactly or with but slight modification. WRITE FOR CATALOG TODAY.



DM C-1 Flush mounted UHF Annular Slot Antenna. →
V.S.W.R.—2.4:1 from 225 to 400 mc
Contour—from flat to 30" radius
Weight—Maximum 15 pounds



DM CNI-1 Duplex UHF L-band Tail Fin Antenna. →
V.S.W.R.—2:1 for both UHF and L-band antenna
Mounting—within dielectric tail fin cap
Weight — 4.31 pounds . . . separate input connectors eliminate external diplexing filters.

DM C7-2 High Speed UHF Blade Antenna. →
V.S.W.R.—2.5:1 from 225 to 400 mc
Mounting—duplicates AT-256/ARC Antenna
Drag—3 pounds for DM C7-2 versus 17.5 pounds for AT-256 at Mach 0.9 and 25,000 feet altitude.
Weight—Approx. 20 ounces

Positions are available for advanced electronic engineers. Send resume to New York Office.

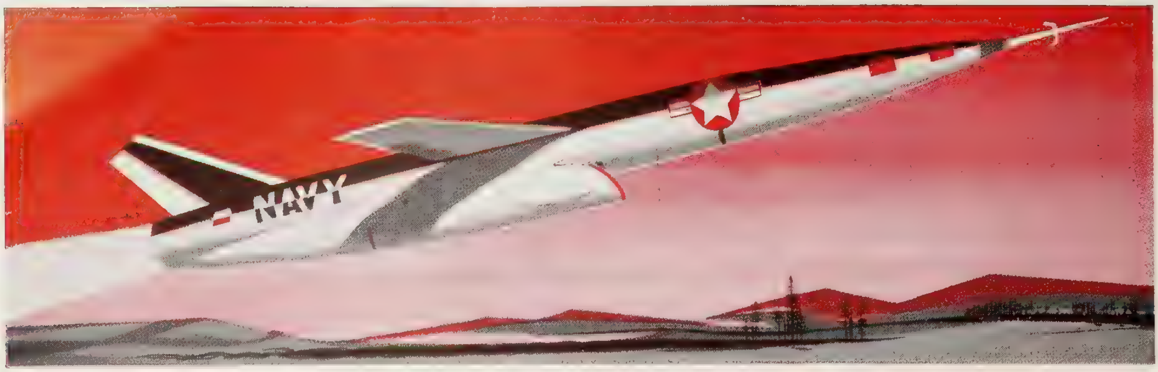
MISSILE
PURCHASING
DIRECTORY

inertial guidance for the Navy's Regulus II



the brain behind the accuracy of the Martin Mace

now in use on the Air Force's Thor intermediate range ballistic missile

See **AC**

. . . top quality

gyros and gyro-accelerometers

now produced in volume

It takes all the technical know-how of American industry to produce gyroscopes in volume to the quality standards needed for inertial guidance systems. The sensitivity of the gyro-accelerometers (used to sense the slightest deviation in flight) is the key to the success or failure of the missile. AC gyro-accelerometers are setting the world's highest standards of quality . . . meet minimum tolerances required . . . and they have withstood as much as 5,000 to 7,000 hours of operation without significant loss of efficiency. Gyros available for immediate delivery: 75×10^6; 10×10^6; 2×10^5; 1×10^4.

—If you are an engineer with electrical, mechanical or electronic backgrounds, contact Mr. Cecil Sundeen, Supervisor of Technical Employment, Dept. G, in care of AC . . . the Electronics Division of General Motors, Milwaukee 1, Wisconsin.

Producers of: AChiever Inertial Guidance Systems • Afterburner Fuel Controls • Bombing Navigational Computers Gun-Bomb-Rocket Sights • Gyro-Accelerometers • Gyroscopes • Speed Sensitive Switches • Speed Sensors • Torquemeters

MISSILE PURCHASING DIRECTORY

Below are listed over 3,000 companies engaged in the missile business, along with their address, phone number, and key purchasing and sales personnel. Information concerning type of company activity may be determined by the coding at the end of each listing. Codings are explained in the lower right hand corner of every other page. The editors have made every effort to obtain listings for *all* companies active in the missile industry, but recognize that with a first issue some companies will be omitted. To the best of our abilities, *at least* two inquiries were sent to all missile and missile parts manufacturers. Companies not listed but interested in being listed in future issues should write to: Editor, MISSILE MARKET GUIDE & DIRECTORY EDITION, American Aviation Publications, 1001 Vermont Ave., N. W., Washington, D. C.

1957-1958
AIRCRAFT YEAR BOOK

OFF PRESS

Standard reference of U. S. aviation

AIRCRAFT YEAR BOOK FOR 1957-58

THE 1957-58 EDITION offers more to its readers than ever before. *Completely redesigned* throughout, the book contains more valuable information, more illustrations, more diagrams, more of everything than in any other issue in the thirty-nine years that *Aircraft Year Book* has served as the aircraft industry's own official record of its activities and accomplishments.

Aviation's standard reference for nearly four decades, *Aircraft Year Book* is now edited and produced by American Aviation Publications, the world's largest aviation publisher. The new 1957-58 edition, encompassing the most complete review of American aviation ever assembled, is now available.

385 photos 98 drawings 432 pages

- Photographs, specifications, and three-view drawings of planes, engines, and missiles now in production.
- A pictorial review of outstanding aviation events of the past year.
- A summary of aircraft company and airline operations during 1957.
- A digest of current aircraft and missile research progress.
- A survey of aviation activities in the Army, Navy, Air Force, and other government departments and agencies.
- A chronology of American aviation history from its early beginnings to the present day.

OFFICIAL ANNUAL OF THE AIRCRAFT INDUSTRIES ASSOCIATION

$8 per copy in all other countries.

MISSILE FRAME

The frame is the skin and structure of the missile, including fins, if any. In the case of solid propellant missiles, the motor casing may account for the bulk of the frame; in the case of liquid propellant missiles, fuel tanks may be an integral part of the frame.

DRONE and SMALL MISSILE SYSTEMS

Research and Development at Rheem Aircraft Division has a record of achievement in the field of drone and small missile systems. The capability for complete "program management" is manifested in the list of current and completed projects and the areas of responsibility covered.

Production

Rheem Aircraft is a division of world-wide Rheem Manufacturing Company which operates 17 plants in the United States...and with its associated and licensed companies operates 18 plants in 12 countries abroad. These extensive facilities coupled with Rheem's years of aircraft production experience provide the capability for the quantity production of drone and missile systems.

From specs to space... Crosley

Long-experienced leader in electronics and airframe projects, Crosley now musters its vast capabilities for vital missile work.

More than a thousand trained engineers and technicians . . . modern facilities (including the technical resources of the Avco Research Laboratory and Research and Advanced Development Division) enable Crosley to carry through a complete missile program . . . from basic design through development and into production.

Crosley, together with its associated Avco Divisions, offers complete facilities for:

- Weapons systems management from initial concept to production
- Research, development and engineering design of: nose cones, airframes, electronics, control systems, telemetering, automatic test and support equipment, ground-handling equipment and logistics
- Production and manufacturing of entire missile weapons.

Crosley

A Division of **Avco** Manufacturing Corporation

1329 Arlington Street • Cincinnati 25, Ohio

Crosley's *Honeycombing* in aluminum and stainless steel provides maximum strength at minimum weight for airframe components. Advanced chem-milling techniques and processes are also available at Crosley.

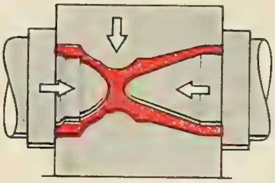
NO WONDER WE MAKE SO MANY

CAMERON ONE PIECE FORGED MISSILE NOZZLES

1. Have no welds
2. Require less machining
3. Are lower in cost

A better nozzle for less money has put Cameron way ahead in production of these important missile parts. Cameron's exclusive split-die forging process makes this possible. Each nozzle is forged from a single heated billet of specified steel. This steel is produced in Cameron's own melt shop under the closest possible control. From these perfect billets our specially designed split-die presses forge a near final shape.



Movement of the three elements in the split-die process.

No welds are required and machining is greatly simplified—grain structures are perfect.

Missile nozzles produced by this method are supplied as finished forgings ready for economical machining or completely machined to specification. At every single phase of manufacture, each nozzle is checked by the most modern methods used today.

The Cameron split-die process has successfully solved many unusual forging problems in a wide variety of end uses. Some of these include critical airframe members, jet engine components, propeller blades and hubs, atomic reactor valves and many high pressure controls for the oil industry.

Cameron has extended the great advantage of ferrous forged members to include shapes impossible to produce heretofore. Present production of missile nozzles includes diameters to 28″ with large open sections and elongated double conical thin sections to 36″ in length. In weight our forgings range to 8,000 lbs. and our high quality alloys satisfy many unusual demands. If you need forgings in this group and, of course, if you need nozzles, call, write or come by . . .

we were there

. . . when Lindbergh flew the Atlantic in 1927. Fuel and oil for his engine were carried through tubular parts made by A.T.B.

Now assemblies and parts from A.T.B. can be found on the DC-7, Constellation, B-52, F-101, F-105, and others. We were also aboard the supersonic X-1.

The know-how gained through all these years is available for the space age we are now entering. We welcome your inquiries. Send for our latest catalog.

the Conquest of Outer Space...
A vital factor in NATIONAL
REPRESENTATIVES IN BALTIMORE

SECURITY

America is awake to the urgent need for the combined efforts of science, engineering and industry to back up the military in leading the way to lasting peace.

At Westinghouse Air Arm, scientists and engineers . . . with more than 20 years of airborne electronics experience behind them . . . are working NOW on these advanced concepts and systems:

- **Space Navigation**
- **Space Flight Control**
- **Space Armament**
- **Space Communication**
- **Space Guidance**
- **Space Reconnaissance**

For information on Air Arm's Space Systems Engineering Group, write: Air Arm Division, Westinghouse Electric Corporation, P.O. Box 746, Baltimore 3, Maryland, or contact your nearest Air Arm representative. V-86000

Exclusive Feature!

YOU NEVER LOSE TIME WITH...

LAMINUM®

—the solid Shim that p-e-e-l-s for adjustment!

Laminated Shims of Laminum have these exclusive features to offer: they're custom-made...any size, any shape...to your own exacting requirements, including rigid Aircraft specifications...with all laminations completely surface-bonded to look and act like solid metal...*yet may be p-e-e-l-e-d to required thickness quickly and easily...for a "thousandth" fit right at the job.* No need for time-consuming, costly extra operations: no machining—no grinding—no stacking—no counting—no miking—and no grit between layers, ever!

THE LAMINATED SHIM CO., INC.
Shim Headquarters since 1913
9304 Union St., Glenbrook, Conn.

Please send, without obligation, detailed Engineering Data File on LAMINUM—the solid Shim that p-e-e-l-s for adjustment.

Exclusive Feature !

YOU ALWAYS GET THE LOWEST POSSIBLE PRICE ON

STAMPINGS

from the Laminated Shim Company

Here's why...we've been concentrating on the manufacture of both Laminated Shims *and* Stampings since 1913. Consequently we have developed our own special equipment and tooling, plus many special skills and techniques of our own—most of them unknown to the average stampings house. The result: always the lowest possible cost, based on your own quality-quantity requirements. Cash in on Laminated Shim Company's better Stampings Service...it's as easy as 1-2-3, as outlined below.

1. FOR A FEW PIECES

at Experimental or Pilot Stage

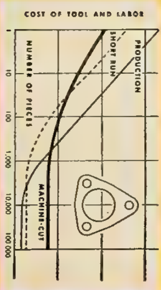
—we use our MACHINE CUT METHOD. No dies needed. Our special equipment, plus our unique techniques, are applied to produce small quantities at very low cost.

2. FOR SHORT RUNS

—we use our SHORT RUN METHOD. "Temporary" low-cost tooling, simple dies, plus special presses go to work to produce something more than "just a few." Quality is high — costs stay low.

3. FOR PRODUCTION RUNS

—we use our PRODUCTION RUN METHOD. Here is where our production toolings apply to great advantage, and when dies are needed, charges are moderate. The chart tells the story...top quality stampings at lowest possible unit cost.



ANY ONE OF THESE 3 METHODS WILL PRODUCE

THE LAMINATED SHIM CO., INC.
Stampings Headquarters since 1913
9304 Union St., Glenbrook, Conn.

Please send, without obligation, your 12-page Stampings Booklet that shows how to save on stampings.

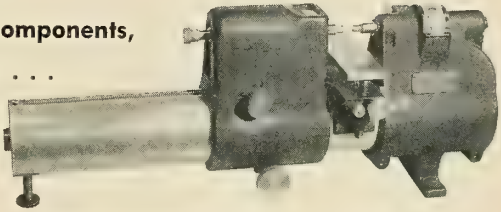
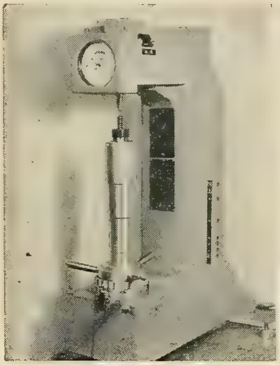
QUALITY CONTROL

COM SERVICE • QUALITY SINCE 1929 PAS

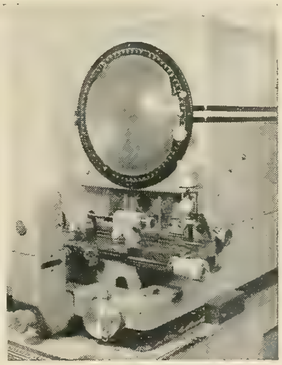
When close tolerances are demanded in Missile Components, we can achieve this in . . . prototype work, in production and in assembly.



SUPERMICROMETER measures to .00005"



HARDNESS TESTER
Used on all metals



OPTICAL COMPARATOR
Greatly magnifies parts

SURFINDICATOR
Electronically measures surfaces in microinches

Inspection is at machine operation level—every hour with records kept for final report. Our vigilant program of Quality Control by highly trained experts includes use of air gages and other modern techniques . . . a distinctive service which gives Screw Products Corporation leadership in high-precision production.

Order your automatic and prototype parts where you get real efficiency, economy and personal service.

Now in
MONEL
The New
CHERRY
"800"
RIVET
Newest in the Cherry High Clinch Rivet Line
1
2
3
4
5

All of the established Cherry High Clinch features are now in the "800" Monel rivets:
(1) high clinch; (2) positive hole fill; (3) wide grip range; (4) uniform stem retention; (5) positive inspection—which now includes grip length stamped on rivet head.

New design concepts are possible with the complete line of Cherry High Clinch rivets. Smaller fasteners—stronger materials—a complete range of temperature and strength applications suited to your problems. The new Cherry "800" in Monel, the "700" in aluminum, and the "600" high-strength, high-temperature rivet in A286 stainless steel give you a complete selection—all in the same proved Cherry High Clinch configuration*.

For technical data on the new Cherry "800" Monel and other Cherry High Clinch rivets, write Townsend Company, Cherry Rivet Division, P. O. Box 2157-Z, Santa Ana, Calif.
